1. INTRODUCTION

This manual describes how the GP series balance works and how to get the most out of it in terms of performance.

Read this manual thoroughly before using the balance and keep it at hand for future reference.

1-1 About This Manual

This manual consists of the following five parts:

- Basic operation...Describes precautions on handling the balance, balance construction and basic balance operation.
- Adapting to the environment...Describes response adjustment, calibration and calibration test.
- Functions...Describes various functions of the balance.
- RS-232C serial interface...Describes RS-232C serial interface output and external contact input. The RS-232C serial interface outputs weighing data and controls the balance. The external contact input commands the balance re-zeroing and data output.
- Maintenance...Describes maintenance, error codes, troubleshooting, specifications and options.

1-2 Features

- Large Vacuum Fluorescent Display, easy to read.
- Dust-tight and Protected Against Water Jets (Complying with IP65), allows washing with water.
- Built-in Calibration Weight (hereinafter referred to as internal mass), allows easy calibration, adjustment and maintenance of the balance.
- Automatic Self Calibration, using the internal mass, adapting to changes in temperature.
- Self Check Function, provided to self-check the balance using the internal mass.
- Automatic Response Adjustment, adapting to vibration and drafts in the environment.
- High Response Speed, the time to read a displayed value after a sample is placed on the pan has been shortened by using the Super Hybrid Sensor (SHS). (Approx. 1.5 seconds when FAST is selected for the response rate.)
- Data Memory Function, storing weighing data, calibration data or unit mass in the counting mode. It can also store tare values or upper and lower limit values for the comparator function. Interval Memory Mode is provided to store the weighing data periodically.
- Good Laboratory Practice (GLP) data output using the standard RS-232C serial interface.
- Clock and Calendar Function, adding the time and date to the output data.
- Comparator Indicators, displaying the comparison results, H, OK or LO.
• Capacity Indicator, displaying the weight value in percentage relative to the weighing capacity.
• Hold Function, provided for weighing a moving object such as an animal.
• Multiple Weighing Units, with most of the common units used around the world.
• Density Mode, for calculating the density of a solid.
• Accumulation Function, adding the weight values and outputting the sum.
• Adjustable Display Position, the standard type balance has a swing-arm to adjust the display position for optimum viewing. Separate display type balances (GP-30KS/100KS) are also available.
• Windows Communication Tools (WinCT), allows easy communication with Windows 95/98. Windows is a registered trademark of Microsoft Corporation.
• Reference Card, provided for a quick reference to the balance operation.
• Underhook, available as an option, for measuring density and weighing magnetic materials.
• Comparator Output (OP-04) and Analog Voltage Output (OP-06) are available as options.

1-3 Compliance

Compliance with FCC Rules

Please note that this equipment generates, uses and can radiate radio frequency energy. This equipment has been tested and has been found to comply with the limits of a Class A computing device pursuant to Subpart J of Part 15 of FCC rules. These rules are designed to provide reasonable protection against interference when equipment is operated in a commercial environment. If this unit is operated in a residential area, it might cause some interference and under these circumstances the user would be required to take, at his own expense, whatever measures are necessary to eliminate the interference.

(FCC = Federal Communications Commission in the U.S.A.)

Compliance with EMC Directives

This device features radio interference suppression in compliance with valid EC Regulation 89/365/EEC.
2. UNPACKING THE BALANCE

2-1 Unpacking

- The balance is a precision instrument. Unpack the balance carefully. Keep the packing material to be used for transporting the balance in the future.

- The packing contents depend on the balance model. See the illustrations to confirm that everything is contained.

**Standard type: GP-12K/20K/22K/30K/40K/60K/100K/102K**

**Note**

Please confirm that the AC adapter type is correct for your local voltage and receptacle type.
Separate display type: GP-30KS/100KS

RS-232C serial interface (External input terminal)

AC adapter jack

Weighing pan

Option cover

AC adapter plug

Hard to insert due to its design (dust-tight, protected against water jets). Insert firmly.

Display

Main unit

Display stand

Leveling foot

(The cable length between the display and the main unit is 3 meters.)

Keys

Acknowledged knob

Loosen the knob to adjust the viewing angle of the display. After adjustment, tighten the knob to secure the display.

Clear display cover

Note

Please confirm that the AC adapter type is correct for your local voltage and receptacle type.

2-2 Installing the Balance

Install the balance as follows:

1. Refer to "3. PRECAUTIONS" for installing the balance.

2. Adjust the leveling feet to level the balance. Confirm it using the bubble spirit level.

3. Confirm that the adapter type is correct for the local voltage and power receptacle type.

4. Connect the AC adapter to the balance. Warm up the balance for at least 30 minutes with nothing on the weighing pan.
3. PRECAUTIONS

To get the optimum performance from the balance and acquire accurate weighing data, note the following:

3-1 Before Use

- Install the balance in an environment where the temperature and humidity are not excessive. The best operating temperature is about 20°C / 68°F at about 50% relative humidity.
- Install the balance where it is not exposed to direct sunlight and it is not affected by heaters or air conditioners.
- Install the balance where it is free of dust.
- Install the balance away from equipment which produces magnetic fields.
- Install the balance in a stable place avoiding vibration and shock. Corners of rooms on the first floor are best, as they are less prone to vibration.
- The weighing table should be solid and free from vibration, drafts and as level as possible.
- Level the balance by adjusting the leveling feet and confirm it using the bubble spirit level.
- Ensure a stable power source when using the AC adapter.
- Warm up the balance for at least 30 minutes. Plug in the AC adapter as usual.
- Calibrate the balance before use or after having moved it to another location.

Caution
Do not install the balance where flammable or corrosive gas is present.

3-2 During Use

- Discharge static electricity from the material to be weighed (hereinafter referred to as sample). When a sample could have a static charge, the weighing data is influenced. Try to keep the ambient humidity above 45%RH or use the metal shield case.
- This balance uses a strong magnet as part of the balance assembly, so please use caution when weighing magnetic materials such as iron. If there is a problem, use the underhook on the bottom of the balance to suspend the material away from the influence of the magnet.

- Cancel the temperature difference between a sample and the environment. When a sample is warmer (cooler) than the ambient temperature, the sample will be lighter (heavier) than the true weight. This error is due to a rising (falling) draft around the sample.

- Make each weighing gently and quickly to avoid errors due to changes in the environmental conditions.

- Do not drop things upon the weighing pan, or place a sample on the pan that is beyond the balance weighing capacity. Place a sample in the center of the weighing pan.

- Do not use a sharp instrument such as a pencil to press the keys. Use your finger only.

- Press the RE-ZERO key before each weighing to prevent possible errors.

- Calibrate the balance periodically so as to cancel possible errors.

- Take into consideration the affect of air buoyancy on a sample when more accuracy is required.

- Keep the balance interior free of dust and foreign materials.

3-3 After Use

- Avoid mechanical shock to the balance.

- Do not disassemble the balance. Contact the local A&D dealer if the balance needs service or repair.

- Do not use organic solvents to clean the balance. Clean the balance with a lint free cloth that is moistened with warm water and a mild detergent.

- Do not allow the balance to be immersed in water. Even though the balance complies with IP65 (Dust-tight and Protected Against Water Jets), the balance will not withstand being completely immersed in water.

3-4 Power Supply

- When the AC adapter is connected, the balance is in the standby mode if the standby indicator is on (refer to “3-5 Display Symbols and Key Operation”). This is a normal state and does not harm the balance. For accurate weighing, plug in the AC adapter and warm up the balance for at least 30 minutes before use.
3-5 Display Symbols and Key Operation

Key operation
Key operation affects how the balance functions. The basic key operations are:
- "Press and release the key immediately" or "Press the key" = normal key operation during measurement
- "Press and hold the key"

Display symbols
- Displays memory data information
- Displays the weighing data relative to the weighing capacity, in percentage, in the weighing mode (Capacity indicator)
- Response indicators
- Animal mode indicator
- Comparator indicators
- Units
- Interval memory standby indicator
- Interval memory active indicator
- Data number of the data currently displayed
- Weighing data or stored data
- Blinking indicators

Each key, when pressed or when pressed and held, functions as follows:

<table>
<thead>
<tr>
<th>Key</th>
<th>When pressed</th>
<th>When pressed and held</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;O CAGE&quot;</td>
<td>Turns the display ON and OFF. The standby indicator is displayed when the display is turned off. The weighing mode is enabled when the display is turned on. This key is available anytime. Pressing the key during operation will interrupt the operation and turn the display OFF.</td>
<td></td>
</tr>
<tr>
<td>&quot;A SAMPLE&quot;</td>
<td>In the weighing mode, turns the minimum weighing value ON and OFF. In the counting or percent mode, enters the sample storing mode.</td>
<td>Enters the function table mode. Refer to &quot;9. FUNCTION TABLE&quot;.</td>
</tr>
<tr>
<td>&quot;MODE&quot;</td>
<td>Switches the weighing units stored in the function table. Refer to &quot;4. WEIGHING UNITS&quot;.</td>
<td>Performs response adjustment and self check.</td>
</tr>
<tr>
<td>&quot;CAL&quot;</td>
<td>Performs calibration of the balance using the internal mass.</td>
<td>Displays other items of the calibration menu.</td>
</tr>
<tr>
<td>&quot;PRINT&quot;</td>
<td>Stores the weighing data in memory or outputs to a printer or personal computer depending on the function table settings. (Factory setting = output)</td>
<td>No function at the factory setting By changing the function table: Outputs “Title block” and “End block” for GLP report. Displays the data memory menu.</td>
</tr>
<tr>
<td>&quot;ZERO&quot;</td>
<td>Sets the display to zero.</td>
<td></td>
</tr>
</tbody>
</table>
3-6 Smart Range Function

The GP-22K and GP-102K are equipped with two ranges. The precision range has a higher resolution. The standard range has normal resolution.

The range is switched automatically, depending on the value displayed. Pressing the RE-ZERO key allows weighing in the precision range, regardless of the tare value. (Smart range function)

The range can be fixed to the standard range, by pressing the SAMPLE key.

Note

Once the range is switched to the standard range, it will not switch to the precision range automatically even when the displayed value becomes within the precision range value. Use the RE-ZERO or SAMPLE key to activate the precision range again.

Below is a description of how the Smart Range actually functions, using the GP-102K
(Precision range=61 kg×1 g, Standard range=101 kg×10 g)

1. Press the RE-ZERO key.
   The balance will start weighing, using the precision range.

2. Place a container, on the weighing pan, to be used as a tare.
   The value displayed exceeds the precision range value. So, the range will be switched to the standard range.

3. Press the RE-ZERO key.
   The balance will be switched to the precision range.

4. Place a sample on the pan.
   The value displayed is within the precision range value. So, the balance will perform a weighing, using the precision range.

<table>
<thead>
<tr>
<th>Precision range/standard range value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Precision range</strong>&lt;br&gt;(after RE-ZERO is pressed)</td>
</tr>
<tr>
<td>Up to 6.1009 kg</td>
</tr>
<tr>
<td><strong>Standard range</strong></td>
</tr>
</tbody>
</table>
4. WEIGHING UNITS

4-1 Units

With the GP series balance, the following weighing units and weighing modes are available:

- Counting mode
- Percent mode
- Density mode (To use this mode, it must be stored in the function table as described on the next page. For details about this mode, refer to "13. DENSITY MEASUREMENT". To select this mode, press the [MODE] key until the processing indicator blinks with the unit "g" displayed. "DS" appears only when the density value is displayed.)
- Programmable-unit (No unit displayed. For details, refer to "12. PROGRAMMABLE-UNIT").

A unit or mode can be selected and stored in the function table as described in "4-2 Changing the Units". If a weighing mode (or unit of weight) has been turned off, that mode or unit will be missing in the sequence. Tael has four varieties, one of which can be selected and installed at the factory.

For details about the units and modes, see the table below:

</table>
4-2 Changing the Units

The units or modes can be selected and stored in the function table. The sequence of displaying the units or modes can be arranged so as to fit the frequency of use in the function table.

Select a unit or mode and arrange the sequence of display as follows:

1. Press and hold the SAMPLE key until \( \text{BASE} \) of the function table is displayed, then release the key.

2. Press the SAMPLE key several times to display \( \text{Unit} \).

3. Press the PRINT key to enter the unit selection mode.

4. Specify a unit or mode in the order to be displayed using the following keys.
   - SAMPLE key: To sequentially display the units.
   - RE-ZERO key: To specify a unit or mode. The stabilization indicator appears when the displayed unit or mode is specified.

5. Press the PRINT key to store the units or modes. The balance displays \( \text{End} \) and then displays the next menu item of the function table.

6. Press the CAL key to exit the function table. Then the balance returns to the weighing mode with the selected unit.

---

5. WEIGHING

5-1 Basic Operation (Kilogram Mode)

1. Place a container on the weighing pan, if necessary. Press the RE-ZERO key to cancel the weight (tare). The balance displays \( 0.0000 \text{ kg} \). (The decimal point position depends on the balance model.)

2. Place a sample on the pan or in the container.

3. Wait for the stabilization indicator to be displayed. Read the value.

4. Remove the sample and container from the pan.

Notes
To use another unit, press the MODE key and select an appropriate unit.

Press the SAMPLE key to turn on or off the minimum weighing value.

The weighing data can be stored in memory. For details, refer to “11. DATA MEMORY.”
5-2 Counting Mode (PCS)

This is the mode to determine the number of objects in a sample based on the standard sample unit mass. Unit mass means the mass of one sample. The smaller the variables in each sample unit mass is, the more accurate the counting will be. The GP series balance is equipped with the Automatic Counting Accuracy Improvement (ACAII) function to improve the counting accuracy.

Note
If the sample unit mass variable is too large, it may cause a counting error.

Selecting the counting mode
1. Press the MODE key to select pcs (counting mode).

Storing a sample unit mass (Weighing input mode)
2. Press the SAMPLE key to enter the sample unit mass storing mode. Even in the storing mode, pressing the MODE key will switch to the next mode.
3. To select the number of samples, press the SAMPLE key several times. It may be set to 10, 25, 50 or 100.

Note
A greater number of samples will yield more accurate counting result.

4. Place a container on the weighing pan, if necessary. Press the RE-ZERO key to cancel the weight (tare). The number specified in step 3 appears. e.g.: \[ 25 \text{ 0 pcs} \] is displayed if 25 is selected in step 3.

5. Place the number of samples specified on the pan. In this example, 25 pieces.

6. Wait for the stabilization indicator to come on. Press the PRINT key to calculate and store the unit mass. The balance displays \[ 25 \text{ pcs} \] (counting mode) and is set to count samples with this unit mass. (The sample unit mass stored, even if the AC adapter is removed, is maintained in non-volatile memory.)

To improve the accuracy of the unit mass, proceed to step 8.

Notes
If the balance judges that the mass of the samples is too light and is not adequate to be used as the unit mass, it displays \[ L_0 \]. Do not use the samples.

If the balance judges that the mass of the samples is too light to acquire accurate weighing, it displays an error requiring the addition of more samples to the specified number. In the example above, \[ 50 \text{ pcs} \] appears, requiring 25 more samples. Add 25 samples and press the PRINT key. When the unit mass is stored correctly, the balance proceeds to the counting mode.
Key entry of the unit mass value (digital input mode) is possible. For details, refer to “11-4 Memory for Unit Mass in the Counting Mode”

Counting operation

7 Place the samples to be counted on the pan.

Note

Up to 50 unit masses can be stored in memory for the multiple sample. For details, refer to “11. DATA MEMORY”.

Counting mode using the ACAI function

The ACAI is a function that improves the accuracy of the unit mass automatically by increasing the number of samples as the counting process proceeds.

8 If a few more samples are added, the processing indicator turns on. To prevent an error, add three or more. The processing indicator does not turn on if overloaded. Try to add the same number of samples as displayed.

9 The balance re-calculates the unit mass while the processing indicator is blinking. Do not touch the balance or samples on the pan until the processing indicator turns off.

10 Counting accuracy is improved when the processing indicator turns off.

Each time the above operation is performed, a more accurate unit mass will be obtained. There is no definite upper limit of ACAI range for the number of samples exceeding 100. Try to add the same number of samples as displayed.

11 Remove all the samples used in ACAI and proceed with the counting operation using the improved unit mass.

Note

ACAI will not function on the unit mass entered using the keys, or digital input mode.
5-3 Percent Mode (%)

This is the mode to display the weight value in percentage compared to a 100% reference mass and is used for target weighing or checking the sample variable.

Selecting the percent mode
1. Press the MODE key to select % (percent mode). If the percent mode can not be selected, refer to "4. WEIGHING UNITS".

Storing the 100% reference mass
2. Press the SAMPLE key to enter the 100% reference mass storing mode. Even in the storing mode, pressing the MODE key will switch to the next mode.
3. Place a container on the weighing pan, if necessary. Press the RE-ZERO key to cancel the weight (tare). The balance displays 100.0 %.
4. Place the sample to be set as the 100% reference mass on the pan or in the container.
5. Press the PRINT key to store the reference mass. The balance displays 100.000 %. (The decimal point position depends on the reference value. The reference mass stored, even if the AC adapter is removed, is maintained in non-volatile memory.)

Note
If the balance judges that the mass of the sample is too light to be used as a reference, it displays Lo. Do not use the sample.
6. Remove the sample.

Reading the percentage
7. Place a sample to be compared to the reference mass on the pan. The displayed percentage is based on the 100% reference mass.
5-4 Accumulation Function

The accumulation function adds the weighing data and displays the total value.

To use the accumulation function, set the “Accumulation function (Add)” parameter of the function table as described below.

Note
While the accumulation function is in use, the data memory function is not available. When using the accumulation function, make sure that the “Data memory (dREA)” parameter of the function table is set to “0”.

Selecting the unit
1. Press the [MODE] key to select a unit to be used for accumulation.

Note
While the accumulation function is in use, unit selection using the [MODE] key is not available.

Setting the function table
2. Press and hold the [SAMPLE] key until [bAFnc] of the function table is displayed, then release the key.
3. Press the [PRINT] key.
4. Press the [SAMPLE] key several times to display [Add 0].
5. Press the [RE-ZERO] key to display [Add 1].

Note
To disable the accumulation function, set the “Accumulation function (Add)” parameter to “0”.
6. Press the [PRINT] key to store the setting.
7. Press the [CAL] key to return to the weighing mode.
Using the accumulation function

Use the keys below to operate the accumulation function.

**MODE** key: Displays the weighing data and the total value alternately each time it is pressed. Will not change the unit while the accumulation function is in use.

**RE-ZERO** key: Sets the display to zero while the weighing data is displayed. Deletes the total value while the total value is displayed.

**PRINT** key: Outputs and adds the weighing data while the weighing data is displayed. Outputs the total value while the total value is displayed.

1. Press the **RE-ZERO** key to set the display to zero.
2. Place a sample on the pan. The weight value is displayed.
3. Press the **PRINT** key. The weight value is added to the total and output. The accumulation number at the upper left of the display increases by one.
4. Repeat steps 1-3 to accumulate more data.
5. Press the **MODE** key to display the total value.

**Outputting the value**

6. Press the **PRINT** key to output the total value.
7. Press the **RE-ZERO** key to delete the total value.

**Notes**

The output format depends on the function table setting.

While the accumulation function is in use, the data memory function is not available.

To disable the accumulation function, set the “Accumulation function (Disp)” parameter to “0”.

When the “Data number output (d-no)” parameter is set to “1”, the accumulation number will be output before the weighing data.

When the accumulation number exceeds 99, the display will show “OL.”

When the total value exceeds the maximum displayable value (999,9999), the display will show “OL.”
6. RESPONSE ADJUSTMENT / SELF CHECK FUNCTION

This function detects the influence on weighing that is caused by drafts and/or vibration at the place where the balance is installed and sets the response characteristic automatically. When this function is selected, the balance self-checks the performance at the same time.

Two modes of response adjustment are available: automatic and manual.

The function has three rates as follows:

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Parameter</th>
<th>Response characteristic</th>
<th>Display refresh rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAST</td>
<td>Cond 0</td>
<td>Fast response, Sensitive value</td>
<td>If the response rate is changed as follows:</td>
</tr>
<tr>
<td>MID.</td>
<td>Cond 1</td>
<td>Slow response, Stable value</td>
<td>MID. or SLOW → FAST = 10 times/second</td>
</tr>
<tr>
<td>SLOW</td>
<td>Cond 2</td>
<td></td>
<td>FAST → MID. or SLOW = 5 times/second</td>
</tr>
</tbody>
</table>

Note

To set the refresh rate of 5 times/second when the response rate is FAST or 10 times/second when the response rate is MID. or SLOW, change the "Display refresh rate (SPd)" parameter of "Environment, Display (dSFnc)" in the function table. For details, refer to "9. FUNCTION TABLE".

6-1 Automatic Response Adjustment / Self Check Function

This function automatically updates the response adjustment by analyzing the influence of the environment on the weighing data and also self-checks the balance performance using the internal mass.

Operation

1. Press and hold the [MODE] key until [RESPONSE] is displayed, then release the key.

2. The balance automatically starts to check the balance performance and sets the response characteristic.

Caution

Do not allow vibration or drafts to affect the balance during adjustment.

3. After automatic adjustment, the balance displays the updated response indicator and returns to the weighing mode. The response indicator remains displayed for a while.

   e.g. "MID OK"

   The example above indicates that the result of the self check is good and [MID] is selected as the response rate.
Notes
If improper performance is found in the self check, the balance displays \textit{CH \quad nc}. Contact the local A&D dealer for repair.

If the automatic response adjustment fails, the balance displays \textit{CH \quad nd}. Check the ambient conditions such as breeze and vibration, also check the weighing pan. Then, perform the adjustment again. To return to the weighing mode, press the \textbf{CAL} key.

If the automatic response adjustment is awkward, try to refine it using the manual response adjustment.

6-2 Manual Response Adjustment

This function manually updates the response adjustment.

Operation

1. Press and hold the \textbf{MODE} key until \textbf{RESPONSE} is displayed, then release the key.

   And then, press the \textbf{MODE} key again quickly.

2. Press the \textbf{MODE} key to select a rate of the response adjustment. Either \textbf{FAST}, \textbf{MID}, or \textbf{SLOW} can be selected.

3. After a few seconds of inactivity the balance displays \textit{End}. Then, it returns to the weighing mode and displays the updated response indicator. The response indicator remains displayed for a while.

Note

The response adjustment can be changed at “Condition (\textit{Cond})” of “Environment, Display (dBSFac)” in the function table. For details, refer to “9. FUNCTION TABLE”.

![Diagram of manual response adjustment]

\textbf{End}

\begin{array}{c}
0.0000 \text{ kg}
\end{array}
7. CALIBRATION

7-1 Calibration Group

The GP series balance has the following modes as a calibration group.

- Calibration
  - Automatic self calibration (calibration due to changes in temperature)
  - Calibration using the internal mass (one-touch calibration)
  - Calibration using an external weight

- Calibration test
  - Calibration test using an external weight (Calibration test does not perform calibration.)

Correction of the internal mass value

Terms

The following terms are defined as follows:

- **Internal mass** = Built-in calibration weight
- **External weight** = A weight that you have. Referred to as a calibration weight when used for calibration.
- **Calibration weight** = A weight used for calibration
- **Target weight** = An external weight used for calibration test

Caution

- Calibration adjusts the balance for accurate weighing.
  - Besides periodic calibration and before each use, perform calibration when:
    - the balance is installed for the first time.
    - the balance has been moved.
    - the ambient environment has changed.
- Do not allow vibration or drafts to affect the balance during calibration.
- To output the data for GLP using the RS-232C interface, set "GLP output (inFD)" of "Data output (data)". For details, refer to "9. FUNCTION TABLE". Time and date are added to the GLP report. If the time or date is not correct, adjust them. For details, refer to "9-9 Clock and Calendar Function".
- Calibration test is available only when "GLP output (inFD)" of "Data output (data)" is set to "1" or "2".
- The calibration and calibration test data can be stored in memory. To store them, set "Data memory (dRwR)" to "3". For details, refer to "11. DATA MEMORY".

Caution on using an external weight

- The accuracy of an external weight can influence the accuracy of weighing. Select an appropriate weight as listed below:

<table>
<thead>
<tr>
<th>Model</th>
<th>Usable calibration weight</th>
<th>Adjustable range</th>
</tr>
</thead>
<tbody>
<tr>
<td>GP-12K</td>
<td>5 kg, 10 kg</td>
<td></td>
</tr>
<tr>
<td>GP-20K</td>
<td>10 kg, 20 kg</td>
<td></td>
</tr>
<tr>
<td>GP-22K</td>
<td>10 kg, 20 kg</td>
<td></td>
</tr>
<tr>
<td>GP-30K/GP-30KS</td>
<td>20 kg, 30 kg</td>
<td></td>
</tr>
<tr>
<td>GP-40K</td>
<td>20 kg, 30 kg, 40 kg</td>
<td></td>
</tr>
<tr>
<td>GP-60K</td>
<td>30 kg, 40 kg, 50 kg, 60 kg</td>
<td></td>
</tr>
<tr>
<td>GP-100K/GP-100KS</td>
<td>60 kg, 80 kg, 100 kg</td>
<td></td>
</tr>
<tr>
<td>GP-120K</td>
<td>60 kg, 80 kg, 100 kg</td>
<td></td>
</tr>
</tbody>
</table>

The calibration weight in bold type: factory setting
The calibration weight value can be adjusted within the range above.

22
7-2 Automatic Self Calibration (Calibration due to changes in temperature)

This function automatically calibrates the balance when the balance detects an ambient temperature change. If GLP output is selected in the function table, the balance outputs the calibration report or stores the data in memory. Automatic self calibration functions even if the display is turned off (standby state).

Caution
If something is on the weighing pan, the balance judges that it is in use and does not perform automatic self calibration. To maintain the calibrated state, keep the weighing pan clear while not in use.

The displays shown below are related to the automatic self calibration.

- Indicates that the balance detects a change in ambient temperature and automatic self calibration will start. If the balance is not used for a few minutes with this indicator blinking, the balance performs automatic self calibration. The blinking duration depends on the environment.

- Indicates that the balance is measuring calibration data. Do not allow vibration or drafts to affect the balance while this indicator is displayed. After calibration, the balance returns to indicate the previous display.

Note
The balance can be used while the indicator blinks. But, it is recommended that to maintain the accuracy, stop using the balance and confirm that there is nothing on the pan and allow the balance to perform self calibration.

7-3 Calibration Using the Internal mass (One-Touch Calibration)

This function calibrates the balance using the internal mass. The only operation required is to press the CAL key.

Operation
1. Plug in the AC adapter and warm up the balance for at least 30 minutes with nothing on the weighing pan.
2. Press the CAL key.
3. The balance displays CAL... and performs calibration using the internal mass. Do not allow vibration or drafts to affect the balance.
4 The balance displays $\text{End}$ after calibration. If the “GLP output ($\text{in} \mathcal{F}_{\text{O}}$)” parameter of the function table is set to “1” or “2”, the balance displays $\text{GLP}$ and outputs “Calibration Report” using the RS-232C interface or stores the data in memory. For details on the calibration report format, refer to “10-2 GLP Report”.

5 The balance will automatically return to the weighing mode after calibration.

About the Internal Mass

The mass of the internal mass may change due to corrosion or other damage caused by the operating environment, or due to aging. Check the internal mass periodically. Correct the internal mass value as necessary. For details, refer to “7-6 Correcting the internal mass value”.

To maintain the weighing accuracy, perform the calibration using an external weight periodically, as described below.

7-4 Calibration Using an External Weight

This function calibrates the balance using an external weight.

Operation

1 Plug in the AC adapter and warm up the balance for at least 30 minutes with nothing on the pan.

2 Press and hold the $\text{CAL}$ key until $\text{CAL out}$ is displayed, then release the key.

3 The balance displays $\text{CAL 0}$.

- If you want to change the calibration weight (a list of usable weights is shown on page 20), press the $\text{SAMPLE}$ key and proceed to step 4.
- If you use the calibration weight value stored in the balance, proceed to step 5.

4 Specify the calibration weight value as follows:

   - $\text{SAMPLE}$ key: To switch the display condition to: “All of the segments blinking” (calibration weight selection mode) or “The last two digits blinking” (value adjustment mode).

   - $\text{RE-ZERO}$ key: To select the calibration weight or adjust the value. In the value adjustment mode, -15 digits appear after +15 digits.

   e.g. Calibration weight value 10001.2 g

Press and hold the key

CAL in

CAL out

Release the key

Select a weight

To next page
PRINT key  To store the new weight value. Even if the AC adapter is removed, the data is maintained in non-volatile memory.

CAL key  To cancel the operation and return to \texttt{CAL 0}.

Note
Digit, when used for the GP series balance, indicates the smallest displayable weighing value.

5 Confirm that there is nothing on the pan and press the PRINT key. The balance measures the zero point. Do not allow vibration or drafts to affect the balance.

The balance displays the calibration weight value.

6 Place the displayed calibration weight on the pan and press the PRINT key. The balance measures the calibration weight. Do not allow vibration or drafts to affect the balance.

7 The balance displays \texttt{End}. Remove the weight from the pan.

8 If the "GLP output (mF0)" parameter, of the function table, is set to "1" or "2", the balance displays \texttt{GLP} and outputs "Calibration Report" using the RS-232C interface or stores the data in memory. For details on the calibration report format, refer to "10-2 GLP Report".

9 The balance will automatically return to the weighing mode.

10 Place the calibration weight on the pan and confirm that the value displayed is within ±2 digits of the specified value. If it is not within the range, check the ambient conditions such as breeze and vibration, also check the weighing pan. Then, repeat steps 1 to 10.
7-5 Calibration Test Using an External Weight

This function tests the balance weighing accuracy using an external mass and outputs the result. This is available only when the “GLP output (inFg)” parameter is set to “1” or “2”. (Calibration test does not perform calibration.)

Operation

1. Connect the AC adapter and warm up the balance for at least 30 minutes with nothing on the pan.

2. Press and hold the [CAL] key until “CC out” is displayed, then release the key.

3. The balance displays “CC 0”.
   - If you want to change the target weight (a list of usable weights is shown on page 20), press the [SAMPLE] key and proceed to step 4.
   - If you use the target weight value stored in the balance, proceed to step 5.

4. Specify the target weight value as follows:
   - [SAMPLE] key: To switch the display condition to: “All of the segments blinking” (target weight selection mode) or “The last two digits blinking” (value adjustment mode).
   - [RE-ZERO] key: To select the target weight or adjust the value. In the value adjustment mode, -15 digits appear after +15 digits.
   - [PRINT] key: To store the new weight value. Even if the AC adapter is removed, the data is maintained in non-volatile memory.
   - [CAL] key: To cancel the operation and return to “CC 0”.

Note
Digit, when used for the GP series balance, indicates the smallest displayable weighing value.
5 Confirm that there is nothing on the pan and press the PRINT key. The balance measures the zero point and displays the measured value. Do not allow vibration or drafts to affect the balance. The balance displays the target weight value.

6 Place the displayed target weight on the pan and press the PRINT key. The balance measures the target weight and displays the measured value. Do not allow vibration or drafts to affect the balance.

7 The balance displays End. Remove the weight from the pan.

8 The balance displays GLP and outputs “Calibration Test Report” using the RS-232C interface or stores the calibration test data in memory. For details on the calibration test report format, refer to “10-2 GLP Report”.

9 The balance will automatically return to the weighing mode.

7-6 Correcting the Internal Mass Value

The GP series balance can correct the internal mass value within the range shown below. This function corrects the internal mass value to conform to an external weight. The corrected mass value is maintained in non-volatile memory even if the AC adapter is removed.

The internal mass value is corrected as follows:

<table>
<thead>
<tr>
<th>Model</th>
<th>Correction reference value</th>
<th>Correction range</th>
</tr>
</thead>
<tbody>
<tr>
<td>GP-12K</td>
<td>10 kg</td>
<td>-2.0 g to +2.0 g</td>
</tr>
<tr>
<td>GP-20K</td>
<td></td>
<td></td>
</tr>
<tr>
<td>GP-22K</td>
<td>20 kg</td>
<td></td>
</tr>
<tr>
<td>GP-30K/GP-30KS</td>
<td></td>
<td></td>
</tr>
<tr>
<td>GP-40K</td>
<td>40 kg</td>
<td></td>
</tr>
<tr>
<td>GP-60K</td>
<td>60 kg</td>
<td></td>
</tr>
<tr>
<td>GP-100K/GP-100KS</td>
<td></td>
<td></td>
</tr>
<tr>
<td>GP-102K</td>
<td>100 kg</td>
<td>-20 g to +20 g</td>
</tr>
</tbody>
</table>

Example: Using the GP-20K

Use the same weight

Correct the internal mass by +0.6 g in 20 kg. Calibrate with the corrected internal mass.
Operation

1. Calibrate the balance using the internal mass. (one-touch calibration) Then, place an external weight and confirm the value to be corrected.

   In the example, the value is to be corrected by 0.6 gram in 20 kilograms.

2. Press the [ON-OFF] key to turn off the display.

3. While pressing and holding the [PRINT] key and the [SAMPLE] key, press the [ON-OFF] key. The balance displays \( P_S \).

4. Press the [PRINT] key. Then the balance displays the function switches.

   Function table (\( \text{I} \): Factory setting)
   switch

   Internal mass (\( \text{D} \): Factory setting)
   correction
   switch

   Set the function table switch and internal mass correction switch to "I" as shown above using the following keys.

   - [SAMPLE] key: To select the switch to change the value. The selected digit blinks.
   - [RE-ZERO] key: To change the parameter of the switch selected.

5. Press the [PRINT] key to store the new setting. The balance returns to the weighing mode.

6. Press and hold the [SAMPLE] key to enter the function table and release the key when \( \text{F:\_\_\_\_} \) is displayed.

7. Press the [SAMPLE] key several times until \( \text{CS in} \) is displayed, then release the key.

8. Press the [PRINT] key to enter the procedure for correcting the internal mass value.

9. Correct the internal mass value using the following keys.

   - [RE-ZERO] key: To select the value.
     (-20 digits appear after +20 digits.)
   - [PRINT] key: To store the new value and display the next menu item of the function table.
   - [CAL] key: To cancel the correction and display the next menu item of the function table.

10. Press the [CAL] key. The balance returns to the weighing mode.

11. Press the [CAL] key to calibrate the balance using the internal mass.

12. Place the external weight on the pan and confirm that the correction has been performed properly. In this example, confirm that the value displayed is within \( \pm 2 \) digits of the correction reference value or 20 kilograms. If the value is not within \( \pm 2 \) digits of the correction value, repeat the above procedure to correct it.
8. FUNCTION SWITCH AND INITIALIZATION

8-1 Permit or Inhibit

The balance stores parameters that must not be changed carelessly (e.g. Calibration data for accurate weighing, Data for adapting to the operating environment, Control data for the RS-232C interface). There are five switches for the purpose of protecting these parameters. Each switch can select either "permit" or "inhibit". The "inhibit" protects parameters against careless operations.

Switches

(The display shown left indicates the factory settings.)

- Function table
  0: To inhibit changes to the function table
  1: To permit changes to the function table
- Calibration using the internal mass (One-touch calibration)
  0: To inhibit calibration using the internal mass
  1: To permit calibration using the internal mass
- Calibration using an external weight
  0: To inhibit calibration using an external weight
  1: To permit calibration using an external weight
- Automatic self calibration (Calibration due to changes in temperature)
  0: To inhibit automatic self calibration
  1: To permit automatic self calibration
- Internal mass correction
  0: To inhibit correction
  1: To permit correction

Operation

1. Press the ON:OFF key to turn off the display.

2. While pressing and holding the PRINT key and the SAMPLE key, press the ON:OFF key. The balance displays "P5".

3. Press the PRINT key. Then the balance displays the function switches.

4. Set the switches using the following keys.

   SAMPLE key: To select the switch to change the parameter. The selected switch blinks.
   RE-ZERO key: To change the parameter of the switch selected.
   0: To inhibit changes. / Can not be used.
   1: To permit changes. / Can be used.
   PRINT key: To store the new parameter and return to the weighing mode.
   CAL key: To cancel the operation and return to the weighing mode.
8-2 Initializing the Balance

This function returns the following parameters to factory settings.

- Calibration data
- Function table
- The sample unit mass value (counting mode), 100% reference mass value (percent mode)
- The data that is stored in the balance using the data memory function
- External calibration weight and target weight value
- Function switch settings
- Liquid density and temperature in the density mode

**Note**

Be sure to calibrate the balance after initialization.

**Operation**

1. Press the **ON:OFF** key to turn off the display.
2. While pressing and holding the **PRINT** key and the **SAMPLE** key, press the **ON:OFF** key. The balance displays **PS**.
3. Press the **SAMPLE** key to display **CLR**.
4. Press the **PRINT** key.
   To cancel this operation, press the **CAL** key.
5. Press the **RE-ZERO** key.
6. Press the **PRINT** key to initialize the balance.
   The balance will automatically return to the weighing mode.
9. FUNCTION TABLE

The function table reads or rewrites the parameters that are stored in the balance. These parameters are maintained in non-volatile memory, even if the AC adapter is removed.

9-1 Structure and Sequence of the Function Table

The function table menu consists of two layers. The first layer is the “Class” and the second layer is the “Item”. Each item stores a parameter.

Example

This example sets “Stores weighing data” for “Data memory” and “1 minute” for “Interval time”.

**Caution**

The balance may not transmit the data completely at the specified refresh rate, depending on the baud rate or data added to the weighing data such as time, date and ID number.
9-4 Description of the Class “Environment, Display”

**Condition (Cond)**

**Cond 0**
This parameter is for sensitive response to the fluctuation of a weight value. Used for powder target weighing, weighing a very light sample or when quick response weighing is required.
After setting, the balance displays **FAST**.

**Cond 2**
This parameter is for stable weighing with slow response. Used to prevent a weight value from drifting due to vibration or drafts.
After setting, the balance displays **SLOW**.

**Notes**

In automatic response adjustment, the response rate is selected automatically.

With “Hold function (Halo)” set to “ON (1)”, this item is used to set the averaging time.

**Stability band width (St-b)**

This item controls the width to regard a weight value as a stable value. When the fluctuation per second is less than the parameter, the balance displays the stabilization indicator and outputs or stores the data. The parameter influences the “Auto print mode”

**St-b 0**
This parameter is for sensitive response of the stabilization indicator. Used for exact weighing.

**St-b 2**
This parameter ignores slight fluctuation of a weight value. Used to prevent a weight value from drifting due to vibration or drafts.

**Note**

With “Hold function (Halo)” set to “ON (1)”, this item is used to set the stabilization range.

**Hold function (Halo) (Animal weighing mode)**

This function is used to weigh a moving object such as an animal.
When the weighing data is over the weighing range from zero and the display fluctuation is within the stabilization range for a fixed period of averaging time, the processing indicator illuminates and the balance displays the average weight of the animal. When the animal is removed from the weighing pan, the display returns to zero automatically.

This function is available only when the hold function parameter is set to “1” (the animal mode indicator [ANIMAL] illuminates) and any weighing unit other than the counting mode is selected.

The stabilization range and averaging time are set in “Condition (Cond)” and “Stability band width (St-b)”.

<td></td>
</tr>
</tbody>
</table>
Zero tracking (\( \text{trc} \))
This function tracks zero point drift caused by changes in the environment and stabilizes the zero point. When the weighing data is only a few digits, turn the function off for accurate weighing.

\[
\begin{align*}
\text{trc} & \quad 0 \\
\text{trc} & \quad 1
\end{align*}
\]

The tracking function is not used. Used for weighing a very light sample.
The tracking function is used.

Display refresh rate (\( \text{SPd} \))
Period to refresh the display. This parameter influences "Baud rate", "Data output pause" and "Stream mode".

Note
This item is selected automatically in the automatic response adjustment.

Decimal point (\( \text{Pnt} \))
The decimal point format can be selected.

Auto display-ON (\( \text{POn} \))
When the AC adapter is plugged in, the display is automatically turned on without the \([\text{ON:OFF}]\) key operation, to display the weighing mode. Used when the balance is built into an automated system. 30-minute warm up is necessary for accurate weighing.

Auto display-OFF (\( \text{POFF} \))
When the AC adapter is connected and no operation is performed (inactivity state) for 10 minutes, the display is automatically turned off and the standby indicator is illuminated.

Capacity indicator (\( \text{CS} \))
In the weighing mode, the indicator displays the weighing data relative to the weighing capacity in percentage. (Zero = 0%, maximum capacity = 100%)
When the "Data memory (\( \text{dRtR} \))" parameter is set to "1" (to store unit mass in the counting mode), "2" (to store the weighing data), "4" (to store comparator settings) or "5" (to store tare value), the indicator displays the information stored in memory, such as the amount of memory data or data number.

Accumulation function (\( \text{Rdd} \))
The accumulation function adds the weighing data, displays and outputs the total value. For details, refer to "5-4 Accumulation Function."

Display at start (\( \text{rnb} \))
When the weighing accuracy is not so strict, the smallest displayable weighing value can be turned off without any key operation at weighing start. Useful when the balance is built into an automated system.
9-5 Description of the Item “Data output mode”

The parameter setting of the “Data output mode (Pr. b)” applies to the performance when the “Data memory (dRtR)” parameter is set to “2” (to store the weighing data) and when the data is transmitted using the RS-232C interface.

Key mode

When the PRINT key is pressed with the stabilization indicator turned on, the balance outputs or stores the weighing data and the display blinks one time.

Required setting: dout Pr. b 0 Key mode

Auto print modes A and B

When the displayed value is stable and the conditions of “Auto print polarity”, “Auto print difference” and reference value are met, the balance outputs or stores the weighing data.

When the PRINT key is pressed with the stabilization indicator turned on, the balance outputs or stores the data and the display blinks one time.

Mode A: Required setting
dout Pr. b 1 Auto print mode A (reference = zero)
dout RP-P Auto print polarity
dout RP-b Auto print difference

Example
“For weighing each time a sample is placed and removed, with “Ar-d” set to “1” (to adjust zero after the data is output).”

Mode B: Required setting
dout Pr. b 2 Auto print mode B (reference = last stable value)
dout RP-P Auto print polarity
dout RP-b Auto print difference

Example
“For weighing while a sample is added.”

Stream mode

The balance outputs the weighing data continuously regardless of the display condition. The display does not blink in this mode. This mode is not available and the interval memory mode is used when the “Data memory (dRtR)” parameter is set to “2” (to store the weighing data).

Required setting
dout Pr. b 3 Stream mode
dout dRtR 0 Data memory function is not used.
bASFnC SPd Display refresh rate
5.5 bPS Baud rate

Example
“For monitoring data on a computer”

Caution

The balance may not transmit the data completely at the specified refresh rate, depending on the baud rate or data added to the weighing data such as time, date and ID number.
Interval memory mode
The weighing data is periodically stored in memory.

Required setting: $d_{out}$ $P_{-}t$ $3$
Interval memory mode
Data memory function is used.
Stores weighing data.

Optional setting: $d_{out}$ $d_{AR}$ $2$
Interval time
$5$ $-e$ $d$ $1$, $2$, or $3$
Adds the time and date.

Example
"For periodical weighing without a computer command and to output
all of the data, to a computer, at one time"

9-6 Description of the Item “Data format”

A&D standard format $5$ $F$ $T$ $Y$ $P$ $E$ $O$
This format is used when the peripheral equipment can receive the A&D format. If an AD-8121 is
used, set the printer to MODE 1 or 2.

- This format consists of fifteen characters excluding the terminator.
- A header of two characters indicates the balance condition.
- The polarity sign is placed before the data with the leading zeros. If the data is zero, the plus
  sign is used.
- The unit, consisting of three characters, follows the data.

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>US</td>
<td>Unstable header</td>
</tr>
<tr>
<td>OL</td>
<td>Overload header</td>
</tr>
</tbody>
</table>

Stable header (Counting mode)

DP (Dump print) format $5$ $F$ $T$ $Y$ $P$ $E$ $I$
This format is used when the peripheral equipment can not receive the A&D format. If an AD-8121 is
used, set the printer to MODE 3.

- This format consists of sixteen characters excluding the terminator.
- A header of two characters indicates the balance condition. No overload header is used.
- The polarity sign is placed before the data, with spaces in place of leading zeros, if the data is
  not zero or overloaded.
- The unit, consisting of three characters, follows the data.

<table>
<thead>
<tr>

</tbody>
</table>

<table>
<thead>
<tr>
<th>WT</th>
<th>Stable header</th>
</tr>
</thead>
<tbody>
<tr>
<td>US</td>
<td>Unstable header</td>
</tr>
</tbody>
</table>

Stable header (Counting mode)
**KF format**  
*5 iF TYPE 2*

This is the Karl-Fischer moisture meter format and is used when the peripheral equipment can only communicate using this format.

- This format consists of fourteen characters excluding the terminator.
- This format has no header characters.
- The polarity sign is placed before the data, with spaces in place of leading zeros, if the data is not zero or overloaded.
- This format outputs the unit only for a stable value.

```
+ 1 2 7 . 8 g CR LF
```

**MT format**  
*5 iF TYPE 3*

- A header of two characters indicates the balance condition.
- The polarity sign is used only for negative data.
- The weighing data uses spaces in place of the leading zeros.
- The character length of this format changes dependent upon the unit.

```
S 1 2 7 . 8 g CR LF
```

**NU (numerical) format**  
*5 iF TYPE 4*

This format outputs only numerical data.

- This format consists of nine characters excluding the terminator.
- The polarity sign is placed before the data with the leading zeros. If the data is zero, the plus sign is used.

```
+ 0 1 2 7 . 8 CR LF
```

**CSV format**  
*5 iF TYPE 5*

- Separates the data of A&D standard format and the unit by a comma (,).
- Outputs the unit even when the data is overloaded.
- When ID number, data number, time and date are added, outputs ID number, data number, date, time and weighing data in this order and separates each item by a comma and treats all the items as one group of data.

```

OL, + 9 9 9 9 9 9 E + 1 9 g CR LF
```
9-7 Description of the Data Format Added to the Weighing Data

**ID number**  
*dout 5-id 1*  
The number to identify a specific balance.  
- This format consists of seven characters excluding the terminator.

```
L A B - 1 2 3 CR LF
```

**Data number**  
*dout d-no 1*  
This format outputs the data number just before the data is transmitted using the RS-232C interface.  
- This format consists of six characters excluding the terminator.
- When CSV format (5 iF *type 5*) is selected, the period (.) is replaced with a comma (,).

```
N 1 0.0 0 1 CR LF
```

**Date**  
*dout 5-td 2 or 3*  
- The date output order can be changed in "Clock (C, Rdd)". Outputs the year in four-digit format.

```
2 0 0 1 / 1 2 / 3 1 CR LF
```

**Time**  
*dout 5-td 1 or 3*  
- Outputs time in 24-hour format.

```
1 2 : 3 4 : 5 6 CR LF
```

**Tare value**  
- When the tare value in memory is recalled, the tare value is output before the weighing data.

```
P T, + 0 0 0 1 2 3 . 4 . . g CR LF
```

**Comparison results**  
- By setting "Comparison results (C^P-r)" of the function table to "I", the comparison results can be added to the data output using the RS-232C serial interface. Use A&D standard format (*type 0*). The AD-8121 printer can not be used.

The comparison results are added after the header in A&D standard format as below.

```
S T, O K, + 0 1 2 . 3 4 5 6 - - K g CR LF
```

- **Header**
- **Comparison results**
- **Data**
- **Unit**
- **Terminator**

```
<table>
<thead>
<tr>
<th>H</th>
<th>I</th>
</tr>
</thead>
<tbody>
<tr>
<td>O</td>
<td>K</td>
</tr>
<tr>
<td>L</td>
<td>O</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>
```

**Note**
When the data described above is added to the weighing data, the output is in the following order: ID number, Data number, Date, Time and Weighing data.

Note
When “Pound Ounce” is selected, the data is output with the unit of ounce (oz).
9-9 Clock and Calendar Function

The balance is equipped with a clock and calendar function. When the "GLP output (inF0)" parameter is set to "1" or "2" and the "Time/Date output (5 - d)" parameter is set to "1", "2" or "3", the time and date are added to the output data. Set or confirm the time and date as follows:

Operation
1. Press and hold the [SAMPLE] key until [RSTnc] of the function table is displayed, then release the key.
2. Press the [SAMPLE] key several times to display [L AdJ].
3. Press the [PRINT] key. The balance enters the mode to confirm or set the time and date.

Confirming the time
4. The current time is displayed with all the digits blinking.
   - When the time is correct and the date does not need to be confirmed, press the [CAL] key and proceed to step 8.
   - When the time is correct and the date is to be confirmed, press the [SAMPLE] key and proceed to step 6.
   - When the time is not correct and is to be changed, press the [RE-ZERO] key and proceed to step 5.

Setting the time (with part of the digits blinking)
5. Set the time in 24-hour format using the following keys.
   - [SAMPLE] key: To select the digits to change the value. The selected digits blink.
   - [RE-ZERO] key: To increase the value by one.
   - [MODE] key: To decrease the value by one.
   - [PRINT] key: To store the new setting, display [End] and go to step 6.
   - [CAL] key: To cancel the new setting and go to step 6.
Confirming the date

6 The current date is displayed with all the digits blinking.
   • To change the display order of year (Y), month (M) and day (D), press the [MODE] key. The date is output in the order as specified.
   • When the date is correct and the operation is to be finished, press the [CAL] key and proceed to step 8.
   • When the time is to be confirmed again, press the [SAMPLE] key and go back to step 4.
   • When the date is not correct and is to be changed, press the [RE-ZERO] key and proceed to step 7.

Note
The year is expressed using a two-digit format. For example, the year 2000 is expressed as “00”.

Setting the date (with part of the digits blinking)
7 Set the date using the following keys.

- [SAMPLE] key: To select the digits to change the value. The selected digits blink.
- [RE-ZERO] key: To increase the value by one.
- [MODE] key: To decrease the value by one.
- [PRINT] key: To store the new setting, display [End] and go to step 8.
- [CAL] key: To cancel the new setting and go to step 8.

Quitting the operation
8 The balance displays the next menu item of the function table. Press the [CAL] key to exit the clock and calendar function and return to the weighing mode.

Notes
Do not enter invalid values such as a non-existing date when setting the time and date.
When the clock backup battery has been depleted, the balance displays [RTC PF]. Under this condition, press any key and set the time and date. The dead battery only affects the clock and calendar function. Even so, the function works normally as long as the AC adapter is connected to the balance.
9-10 Comparator Function

The results of the comparison are indicated by \( \text{HI} \) \( \text{OK} \) \( \text{LO} \) on the display.

Operating conditions:
- No comparison
- Comparison when the weighing data is stable or overloaded, excluding "near zero"
- Comparison when the weighing data is stable or overloaded, including "near zero"
- Continuous comparison, excluding "near zero"
- Continuous comparison, including "near zero"

To compare, use:
- Upper limit value and lower limit value
- Reference value and tolerance value

Input method:
- Digital input
- Weighing input

For a description of "Comparator mode (CP Fnc)", refer to "9-3 Details of the Function Table".

Setting example 1

(Comparison when the weighing data is stable or overloaded, excluding "near zero", upper limit and lower limit)

Selecting a comparator mode

1. Press and hold the SAMPLE key until \( \text{basFnc} \) of the function table is displayed, then release the key.
2. Press the SAMPLE key several times to display \( \text{CP Fnc} \).
3. Press the PRINT key.
4. Press the RE-ZERO key several times to display \( \text{CP i} \).
5. Press the SAMPLE key to display \( \text{CP in} \).
6. Press the RE-ZERO key several times to display \( \text{CP in 0} \).
7. Press the PRINT key to store the selected mode.

Entering the upper and lower limit values

8. With \( \text{CP H} \) displayed, press the PRINT key. The current setting of the upper limit value is displayed with all of the digits blinking.
   - When the current setting is not to be changed, press the PRINT or CAL key to proceed to step 9.
   - When the current setting is to be changed, press the RE-ZERO key. The balance is now in the digital input mode. To use the weighing input mode, press and hold the MODE key.

Digital Input mode

Change the setting using the following keys.

- SAMPLE key: To select the digit to change the value.
- RE-ZERO key: To change the value of the digit selected.
- MODE key: To switch the polarity.
- PRINT key: To store the new setting and go to step 9.
- CAL key: To cancel the new setting and go to step 9.
Weighing input mode
Press the \textbf{RE-ZERO} key. The balance displays \textbf{00 g}. Place a sample, with a mass that corresponds to the upper limit value, on the pan. Press the \textbf{PRINT} key to store the upper limit value. Remove the sample. The balance displays \textbf{CP Lo}.

9. With \textbf{CP Lo} displayed, press the \textbf{PRINT} key. The current setting of the lower limit value is displayed with all of the digits blinking.
   - When the current setting is not to be changed, press the \textbf{PRINT} or \textbf{CAL} key to proceed to step 10.
   - When the current setting is to be changed, press the \textbf{RE-ZERO} key. The balance is now in the digital input mode. To use the weighing input mode, press and hold the \textbf{MODE} key.
   Enter the lower limit value in the same way as described in step 8. Then, go to step 10.

10. Press the \textbf{CAL} key to exit the comparator function and return to the weighing mode.

Setting example 2
(Continuous comparison, including "near zero", reference value and tolerance value)

Selecting a comparator mode
1. Press and hold the \textbf{SAMPLE} key until \textbf{SP Fnc} of the function table is displayed, then release the key.
2. Press the \textbf{SAMPLE} key several times to display \textbf{CP Fnc}.
3. Press the \textbf{PRINT} key.
4. Press the \textbf{RE-ZERO} key several times to display \textbf{CP 4}.
5. Press the \textbf{SAMPLE} key to display \textbf{CP in}.
6. Press the \textbf{RE-ZERO} key several times to display \textbf{CP in l}.
7. Press the \textbf{PRINT} key to store the selected mode.

Entering the reference and tolerance values
8. With \textbf{CP reEF} displayed, press the \textbf{PRINT} key. The current setting of the reference value is displayed with all the digits blinking.
   - When the current setting is not to be changed, press the \textbf{PRINT} or \textbf{CAL} key to proceed to step 9.
   - When the current setting is to be changed, press the \textbf{RE-ZERO} key. The balance is now in the digital input mode. To use the weighing input mode, press and hold the \textbf{MODE} key.

Digital input mode
Change the setting using the following keys.

- \textbf{SAMPLE} key: To select the digit to change the value.
- \textbf{RE-ZERO} key: To change the value of the digit selected.
- \textbf{MODE} key: To switch the polarity.
- \textbf{PRINT} key: To store the new setting and go to step 9.
- \textbf{CAL} key: To cancel the new setting and go to step 9.

Weighing input mode
Press the \textbf{RE-ZERO} key. The balance displays \textbf{00 g}. Place a sample, with a mass that corresponds to the reference value, on the pan. Press the \textbf{PRINT} key to store the reference value. Remove the sample and go to step 9.
9 With [CP LAB] displayed, press the PRINT key. The current setting of the tolerance value is displayed with all the digits blinking.

- When the current setting is not to be changed, press the PRINT or CAL key to proceed to step 10.
- When the current setting is to be changed, press the RE-ZERO key. The balance is now in the digital input mode. Change the setting using the following keys.

  | SAMPLE key | To select the digit to change the value. |
  | RE-ZERO key | To change the value of the digit selected. |
  | PRINT key | To store the new setting and go to step 10. |
  | CAL key | To cancel the new setting and go to step 10. |

Notes: Enter the tolerance value, in percentage to the reference value, as 100%. Only the digital input mode is available for setting the tolerance value. The MODE key is not used to set the tolerance value.

10 Press the CAL key to exit the comparator function and return to the weighing mode.

Notes
When Pound/Ounce is selected as a weighing unit, enter the values in ounces for comparison. In the density mode, comparison is performed to the density obtained.

9-11 Adding the Comparison Results

By setting "Comparison results (CP-r)" of the function table to "r", the comparison results can be added to the data output using the RS-232C serial interface. Use A&D standard format (TYPE B). The AD-8121 printer can not be used.

The comparison results are added after the header in A&D standard format as below.

```
ST, OK, +01234567 k g CR LF
```

Header Comparison Data Unit Terminator

![| HI | When the comparison result is HI |
| OK | When the comparison result is OK |
| LO | When the comparison result is LO |
| -  | Not applicable |

9-12 Main Display Comparison Function

The main display comparison function displays the comparison results in a magnified way, on the main portion of the display in place of the weight value.

Selecting a unit

1 Press the MODE key to select a unit to be used for comparison.

Note
While the main display comparison function is in use, unit selection using the MODE key is not available.
Setting the function table

2 Press and hold the **SAMPLE** key until \( \text{bPFC} \) of the function table is displayed, then release the key.

3 Press the **SAMPLE** key several times to display \( \text{CP Func} \).

4 Press the **PRINT** key.

5 Press the **SAMPLE** key several times to display \( \text{CP-b } 0 \).

6 Press the **RE-ZERO** key to display \( \text{CP-b } \). 

Note

To disable the main display comparison function, set the “Main display comparison \( \text{CP-b} \)” parameter to “0”.

7 Press the **PRINT** key to store the setting.

8 Press the **CAL** key to return to the weighing mode.

Setting the comparator values

Setting the comparator values as described in the previous section.

Setting example \( \text{CP-3}=\text{Continuous comparison, excluding “near zero”} \)

Using the main display comparison function

1 Press the **RE-ZERO** key to set the display to zero.

2 Place a sample on the pan. The balance performs a comparison using the specified comparison values and displays the comparison results, \( \text{HL, OK or LO} \).

3 Each time the **MODE** key is pressed, the display switches between the standard display and the main display comparison. Note that “0” appears for \( \text{OK} \).

Notes

While the main display comparison function is in use, the processing indicator illuminates as shown in the illustration.

If the comparison is not performed, for example, because the weight value is near zero or unstable, the balance displays the weight value even when the main display comparison function is used.

Even while the main display comparison function is in use, the balance re-zeroing and data output is possible.

Only the unit selected before this function can be used.

While the main display comparison function is in use, the data memory function is not available.
10. ID NUMBER AND GLP REPORT

- The ID number is used to identify the balance when Good Laboratory Practice (GLP) is used.
- The ID number is maintained in non-volatile memory even if the AC adapter is removed.
- The GLP output format is selected at "GLP output (mFQ)" of the function table and can be output to a personal computer or printer using the RS-232C serial interface.
- The GLP output format includes the balance manufacturer, model, serial number, ID number, date, time and space for signature for weighing data, the weight used and results for calibration or calibration test data.
- The balance can output the following reports for GLP.
  "Calibration report" of the calibration, using the internal mass (Calibration due to changes in temperature and one-touch calibration.)
  "Calibration report" of the calibration, using an external weight.
  "Calibration test report" of the calibration test, using an external weight.
  "Title block" and "End block" for the weighing data.
- Calibration and calibration test data can be stored in memory to output several reports at the same time. Refer to "11. DATA MEMORY" for details.
- For details on confirming and setting the time and date, refer to "9-9 Clock and Calendar Function".

10-1 Setting the ID Number

1. Press and hold the SAMPLE key until [ASFnC] of the function table is displayed, then release the key.
2. Press the SAMPLE key several times to display [ID].
3. Press the PRINT key. Set the ID number using the following keys.
   
   RE-ZERO key  To set the character of the digit selected. Refer to the display character set shown below.
   SAMPLE key   To select the digit to change the value.
   PRINT key     To store the new ID number and display [ASFnC].
   CAL key       To cancel the new ID number and display [ASFnC].
4. With [ASFnC] displayed, press the CAL key to return to the weighing mode.

Display character set

```
0 1 2 3 4 5 6 7 8 9 | A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
0 1 2 3 4 5 6 7 8 9 | R b c d e f g h i j k l ñ n ñ p 9 r 9 s u g 4 i y z
```

Space
10-2 GLP Report

Set the following parameters to output the report.

- To print the report, set the "GLP output (\textit{inF\textsubscript{o}})" parameter to "\textit{i}" and use MODE 3 of the AD-8121. For details on using the printer, refer to "15-1 Connection to the AD-8121 Printer".

- To output the report to a personal computer using the RS-232C interface, set the "GLP output (\textit{inF\textsubscript{o}})" parameter to "\textit{2}".

- If the time and date are not correct, set the correct time and date in "Clock (\textit{Cl. RdJ})" of the function table.

Note

For operational details about calibration and calibration test, refer to "7. CALIBRATION".

When the setting is "in Fa 2":
Title block and end block

When weight values are recorded as GLP data, a "Title block" is inserted at the beginning and an "End block" is inserted at the end of a group of weight values in the GLP report.

Note

To output the report to an AD-8121, use MODE 3 of the AD-8121.

Caution

If the data memory function is used, the "Title block" and "End block" can not be output.

Operation

1. With the weighing data displayed, press and hold the PRINT key, then release the key. The "Title block" is output.

2. The weighing data is output according to the parameter setting of the data output mode.

3. Press and hold the PRINT key until "End" is displayed, then release the key. The "End block" is output.

11. DATA MEMORY

Data memory is a function to store weighing data, calibration data and unit mass in memory. Of the
data in memory, the balance can only display the weighing data. The weighing data and calibration
data in memory are available for outputting at one time to a printer or personal computer.

One of the following data sets can be stored:

- Weighing data (Up to 200 sets. 100 sets when the time and date are added.)
- Calibration and calibration test data (latest 50 sets)
- Unit mass in the counting mode (Up to 50 sets)
- Comparator settings (the upper and lower limit values only, up to 20 sets)
- Tare value (Up to 20 sets)

11-1 Notes on Using Data Memory

To use the memory function, set the “Data memory ( \( d_{RM} \))” parameter of the function table. In
addition, for weighing data, set the “Time/Date output (5-\( t \))” parameter. For details on setting the
data memory, refer to “9. FUNCTION TABLE”.

For weighing data, the data contents to be stored and the storage capacity depend on the “Time/Date
output (5-\( t \))” parameter setting.

Releasing “\( L_r \)”

If a different type of data exists in memory when the data is stored, “\( L_r \)” appears blinking in the
upper left of the display. For example, you want to store weighing data but calibration data or unit
mass data remains in memory.

\[
\begin{array}{c}
L_r \\
\end{array}
\]

Under such a condition, before storing data, delete the data in memory as follows:

1. Press and hold the PRINT key until \( L_r \) with “\( n_a \)” blinking is displayed, then release the
   key.

2. Press the RE-ZERO key to display \( L_r \) with “\( C_o \)” blinking.
   The type of data stored in memory appears in the upper left of the display as shown below:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit mass in the counting mode</td>
<td>( PC )</td>
</tr>
<tr>
<td>Weighing data without time and date</td>
<td>( d_1 )</td>
</tr>
<tr>
<td>Weighing data with time and date</td>
<td>( d_2 )</td>
</tr>
<tr>
<td>Calibration or calibration test data</td>
<td>( H )</td>
</tr>
<tr>
<td>Comparator settings</td>
<td>( CP )</td>
</tr>
<tr>
<td>Tare value</td>
<td>( tr )</td>
</tr>
</tbody>
</table>

3. Press the PRINT key to delete all the data in memory.

4. The balance displays \( End \) and returns to the weighing mode.
11-2 Memory for Weighing Data

- The data memory function can store 200 sets of weighing data (100 sets if time and date are added). Even if the AC adapter is removed, the data is maintained in non-volatile memory.
- It is not necessary that the printer or computer be continually connected to the balance, because the balance stores the weighing data in memory.
- The data in memory is available to be displayed on the balance for confirmation, or to output several sets of data at one time to a printer or personal computer. In the function setting, what data is to be added to the output data (ID number, data number, time and date) can be selected.

Storing the weighing data

Note

If "CLr" appears blinking in the upper left of the display, delete the data in memory.

1 Set the "Data memory (dRrR)" parameter to "2".
2 Set the "Time/Date output (T-Ld)" parameter as necessary.
3 The storing operation depends on the "Data output mode (Fr-b)" parameter setting. Four types of operating modes are available to store data.

Key mode
When the PRINT key is pressed and the displayed value is stable, the balance stores the weighing data.

Auto print modes A and B
When the displayed value is stable and the conditions of "Auto print polarity", "Auto print difference" and reference value are met, the balance stores the weighing data.

Interval memory mode
Weighing data is stored at an interval specified in "Interval time (mb)". Press the PRINT key to start and stop this mode.

The data amount in memory

Memory full

Weighing data being displayed

Interval memory standby indicator

Interval memory active indicator

Data number of the data currently displayed

Memory data being displayed

Caution

- When weighing data is being stored in memory, the data cannot be output to a personal computer using the RS-232C interface.
- "FUL" indicates that memory is full or the memory capacity has been reached. More data cannot be stored unless the memory data is deleted.
- Automatic self calibration cannot be used while the interval memory mode is active.
The following commands can not be used during data storage.

- Q Query command for weighing data.
- S Query command for stable weighing data.
- SI Query command for weighing data.
- SIR Query command for continuous weighing data.

Setting the function table

Parameter settings for each output mode are as follows:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Item</th>
<th>Data output mode</th>
<th>Auto print polarity, difference</th>
<th>Data memory function</th>
<th>Interval time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key mode</td>
<td>Prt 0</td>
<td>Not used</td>
<td>dAR A 2</td>
<td>Not used</td>
<td></td>
</tr>
<tr>
<td>Auto print mode A</td>
<td>Prt 1</td>
<td>Prt 0-2</td>
<td>dAR A 2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Auto print mode B</td>
<td>Prt 2</td>
<td>Prt 0-2</td>
<td>dAR A 2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interval memory mode</td>
<td>Prt 3</td>
<td>Not used</td>
<td>dAR A 2</td>
<td>int 0-8</td>
<td></td>
</tr>
</tbody>
</table>

Set each item, depending on the situation, as follows:

<table>
<thead>
<tr>
<th>Data number</th>
<th>No</th>
<th>d-no 0</th>
<th>Time and date</th>
<th>No</th>
<th>5-td 0</th>
<th>Time only</th>
<th>5-td 1</th>
<th>Date only</th>
<th>5-td 2</th>
<th>Both</th>
<th>5-td 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID number</td>
<td>No</td>
<td>5-id 0</td>
<td></td>
<td>Yes</td>
<td>5-id 1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

With 5-td 1, 5-td 2 or 5-td 3 selected, the amount of data to be stored is 100 sets.

Enabling the data memory function

1. Press and hold the SAMPLE key until dAR A 0 is displayed, then release the key.
2. Press the PRINT key several times to display dAR A 0.
3. Press the PRINT key.
4. Press the SAMPLE key three times to display dAR A 0.
5. Press the RE-ZERO key to display dAR A 2.
6. Press the PRINT key to store the setting.
7. Press the CAL key to return to the weighing mode.
Recalling the memory data

Confirm that the "Data memory (dRER)" parameter is set to "2".

1. Press and hold the PRINT key until RECALL is displayed, then release the key.

2. Press the PRINT key to enter the memory recall mode. The type of data appears in the upper left of the display as shown to the right:

   - To proceed to the next data set.
   - To go back to the previous data set.
   - To transmit the current data using the RS-232C interface.

   With SAMPLE held down, press the CAL key
   - To delete the data currently displayed.

   **Note:** Deleting the data will not increase the number of data that can be stored.

3. Press the CAL key to return to the weighing mode.

Transmitting all memory data at one time

Confirm that the "Serial interface (SIF)" parameters are set properly. For details, refer to "9. FUNCTION TABLE" and "15. CONNECTION TO PERIPHERAL EQUIPMENT".

1. Press and hold the PRINT key until RECALL is displayed, then release the key.

2. Press the SAMPLE key to display out.

3. Press the PRINT key to display out no with "no" blinking.

4. Press the RE-ZERO key to display out Go with "Go" blinking.

5. Press the PRINT key to transmit all data using the RS-232C interface.

6. The balance displays CLEAR when all data is transmitted. Press the CAL key to return to the weighing mode.

Deleting all memory data at one time

1. Press and hold the PRINT key until RECALL is displayed, then release the key.

2. Press the SAMPLE key several times to display CLEAR.

3. Press the PRINT key to display CLR no with "no" blinking.

4. Press the RE-ZERO key to display CLR Go with "Go" blinking.

5. Press the PRINT key to delete all data

6. The balance displays End, then RECALL when all data is deleted.

7. Press the CAL key to return to the weighing mode.
11-3 Memory for Calibration and Calibration Test Data

- Calibration data (when and how it is performed) and calibration test data can be stored in memory.
- All the data in memory is available to be output at one time to a printer or personal computer.
- Up to 50 data sets of the latest calibration or calibration test can be stored. When the memory capacity has been reached, "FUL" illuminates in the upper left of the display as shown below.

Storing the calibration and calibration test data

Note

If "CLR" appears blinking in the upper left of the display, delete the data in memory.

Store the calibration and calibration test data as follows:

1. Set the "Data memory ( dRkR )" parameter to "3".
2. Set the "GLP output ( inFO )" parameter to "1" or "2".
3. With the settings above, each time calibration or calibration test is performed, the data is stored automatically.

Transmitting the memory data

Confirm that the "Serial interface ( SIF )" parameters are set properly. For details, refer to "9. FUNCTION TABLE" and "15. CONNECTION TO PERIPHERAL EQUIPMENT" and also confirm that the "Data memory ( dRkR )" parameter is set to "3".

1. Press and hold the PRINT key until out is displayed, then release the key.
2. Press the PRINT key to display [out no] with "no" blinking.
3. Press the RE-ZERO key to display [out Go] with "Go" blinking.
4. Press the PRINT key to transmit all memory data using the RS-232C interface.
5. The balance displays [CLEAR] when all memory data is output. Press the CAL key to return to the weighing mode.

Deleting the memory data

1. Press and hold the PRINT key until out is displayed, then release the key.
2. Press the SAMPLE key to display [CLEAR].
3. Press the PRINT key to display [CLR no] with "no" blinking.
4. Press the RE-ZERO key to display [CLR Go] with "Go" blinking.
5. Press the PRINT key to delete all data
6. The balance displays [out] when all the data has been deleted. Press the CAL key to return to the weighing mode.
11-4 Memory for Unit Mass in the Counting Mode

- The data memory function can store 50 sets of unit mass for the counting mode. Even if the AC adapter is removed, the data is maintained in non-volatile memory. Among the 50 sets, "P01" is the memory function for the standard counting mode.
- The unit mass in memory can be recalled and used for weighing.
- The unit mass in memory can be recalled and changed.

Note
The recalled unit mass can be changed, using the weighing input mode or the digital input mode. The weighing input mode uses the specified number of samples to store the unit mass. The digital input mode enters the unit mass using the keys.

Storing the unit mass
To store a new unit mass: Recall the stored unit mass to be changed ("P01" to "P50"). Then, change the recalled unit mass using the weighing input mode or the digital input mode, and store the new unit mass.

1. Set the "Data memory (dRcR)" parameter to "I".
2. Press the MODE key to select [pcs] (counting mode).
   If "CLR" appears blinking in the upper left of the display, delete the data in memory.

Note
If the counting mode can not be selected, refer to "4. WEIGHING UNITS".

3. Press and hold the PRINT key until the balance enters the sample unit mass confirmation mode. The unit mass last selected is displayed as shown below.

   Unit mass number
   (The third data in memory)
   ➡
   1234567 g
   Unit mass
   All the digits blinking

4. Select the unit mass number to be used, using the following keys.
   RE-ZERO key To increase the unit mass number by one.
   MODE key To decrease the unit mass by one.

5. To change the selected unit mass:
   To use the weighing input mode, press the SAMPLE key to enter the weighing input mode. Go to "Weighing input mode" on the next page.
   To use the digital input mode, press the SAMPLE key, then press and hold the MODE key to enter the digital input mode. Go to "Digital input mode" on the next page.

Notes
ACAI can not be performed directly on the recalled unit mass.
Using the "UN:mm" command, the unit mass can be recalled. (mm indicates a two-digit numerical value 01-50, which corresponds to P01-P50.) The unit mass recalled can be output using the "?UW" command and can be changed using the "UW:" command.
Weighing Input mode

In the weighing input mode, the specified number of samples is placed on the pan to store the unit mass. Re-storing the unit mass or performing Automatic Counting Accuracy Improvement (ACAI) on the re-stored unit mass is possible. Follow the procedure described in "5-2. Counting Mode (PCS)".

Use the following keys to store a unit mass in weighing input mode.

- **RE-ZERO** key: To set the display to zero. \[ 10 \text{ pcs} \rightarrow 10 0 \text{ pcs} \]
- **SAMPLE** key: To change the number of samples to be stored. \[ 10 0 \text{ pcs} \rightarrow 25 0 \text{ pcs} \]
- **PRINT** key: Press, after a sample is placed, to store the unit mass.
- **CAL** key: To return to the unit mass confirmation mode (step 3 in "Recalling the unit mass").
- **MODE** key: Press and hold to go to the digital input mode.

Digital input mode

To use this mode, the sample unit mass must be known beforehand. In the digital input mode, the unit mass value is entered digitally using the keys. The display in the digital input mode is shown to the right.

The digit to be changed blinks.

**Note**

Acai cannot be used on the unit mass stored using the digital input mode.

Use the following keys to store a unit mass in digital input mode.

- **SAMPLE** key: To select the digit to be changed.
- **RE-ZERO** key: To change the value of the selected digit.
- **MODE** key: To change the decimal point position.
- **PRINT** key: To store the unit mass.
- **CAL** key: To return to the unit mass confirmation mode (step 3 in "Recalling the unit mass").
- **MODE** key: Press and hold to go to the weighing input mode.

**Note**

If the set unit mass is out of the setting range, "Error 2" is displayed. For details about the minimum unit mass, refer to "19. SPECIFICATIONS".

Recalling the unit mass

1. Follow steps 1 through 3 in "Storing the unit mass" on the previous page, to enter the sample unit mass confirmation mode.
2. Select the unit mass number to be used, using the following keys.
   - **RE-ZERO** key: To increase the unit mass number by one.
   - **MODE** key: To decrease the unit mass by one.
3. Press the **PRINT** key to confirm the selection and to return to the weighing mode.

To cancel the selection and return to the weighing mode, press the **CAL** key.
11-5 Memory for Comparator Settings

- The data memory function can store 20 sets of upper and lower limit values for the comparator mode. The reference value or tolerance value for the comparator mode can not be stored in memory.
- The upper and lower limit values in memory can be recalled easily using the MODE key and used for weighing.
- The upper and lower limit values in memory can be recalled and changed.

Note
The recalled upper and lower limit values can be changed, using the digital input mode or the weighing input mode. The digital input mode enters the upper and lower limit values using the keys. The weighing input mode uses a sample to store the upper and lower limit values.

Storing the upper and lower limit values
To store new upper and lower limit values: Recall the stored upper and lower limit values to be changed (“C01” to “C20”). Then, change the recalled upper and lower limit values using the digital input mode or the weighing input mode, and store the new value.

1 Press the MODE key to select a unit to be used for storage.

Note
While the data memory function is in use, unit selection using the MODE key is not available.

2 Set the “Data memory (d/R)" parameter to “V”.
   If “Li-” appears blinking in the upper left of the display, delete the data in memory as described in “11-1 Notes on Using Data Memory”.

3 Press and hold the PRINT key until the balance enters the upper and lower limit values confirmation mode. The upper limit value last selected is displayed as shown below.

   Comparator number
   (The third data in memory)

   HI

   ◄ CO3

   Upper limit value
   200000 kg
   All the digits blinking

4 Select the comparator number to be used, using the following keys.
   RE-ZERO key ∆ To increase the comparator number by one.
   MODE key ∆ To decrease the comparator number by one.
   Each time the RE-ZERO key or MODE key is pressed, the displayed value changes as follows: … <-> CO3 HI <-> CO3 LO <-> CO4 HI <-> CO4 LO <-> …

5 To change the selected upper and lower limit values:
   To use the digital input mode, press the SAMPLE key to enter the digital input mode. Go to “Digital input mode” on the next page.

   To use the weighing input mode, press the SAMPLE key, then press and hold the MODE key to enter the weighing input mode. Go to “Weighing input mode” on the next page.

Note
Using the “CN:mm” command, the upper and lower limit values can be recalled. (mm indicates a two-digit numerical value 01-20, which corresponds to C01-C20.) The upper and lower limit values recalled can be output using the “?HI” command or “?LO” command and can be changed using the “HI:” command or “LO:” command.
Digital input mode
In the digital input mode, the upper and lower limit values are entered digitally using the keys.
The display in the digital input mode is shown below.

Use the following keys to store upper and lower limit values in digital input mode.

- **SAMPLE** key: To select the digit to be changed.
- **RE-ZERO** key: To change the value of the selected digit.
- **MODE** key: To switch the polarity.
- **PRINT** key: To store the upper and lower limit values.
- **CAL** key: To return to the upper and lower limit values confirmation mode (step 3 in “Storing the upper and lower limit values”).
- **MODE** key: Press and hold to go to the weighing input mode.

Weighing input mode
In the weighing input mode, a sample is placed on the pan to store the upper and lower limit values.

Notes
Pressing the **CAL** key will interrupt the operation and the balance will return to the upper and lower limit values confirmation mode (step 3 in “Storing the upper and lower limit values”).

To go to the digital input mode, press and hold the **MODE** key.

1. The first display in the weighing input mode depends on the comparator number selected in step 4 in “Storing the upper and lower limit values”.
   For example, when “C03 [HI]” is selected in step 4, the display is the current weight value and the comparator number with [HI] blinking.

2. Place a container on the weighing pan, if necessary.
   Press the **RE-ZERO** key to set the display to zero.

3. Place a sample corresponding to the upper limit value, on the pan or in the container.

4. Press the **PRINT** key to store the upper limit value.
Recalling the upper and lower limit values (Quick selection mode)

The procedure below describes an easy way to recall the upper and lower limit values to be used for weighing. When the recalled upper and lower limit values are to be changed, refer to "Storing the upper and lower limit values".

1. Set the "Data memory (dA:R)" parameter to "Y".

2. Press the MODE key to enter the upper/lower limit value recalling mode. The upper limit value last selected with its comparator number appears. The display is as shown to the right, with all the digits blinking.

3. Press the MODE key to select the value. Each time the MODE key is pressed, the displayed value changes as follows: CO3 HI → CO3 LO → CO4 HI → CO4 LO → .... → CO1 LO → CO1 HI →.

4. Press the PRINT key to confirm the selection. The balance returns to the weighing mode with the selected upper and lower limit values ready for use.

To cancel the selection, press the CAL key. The balance returns to the weighing mode.

Note

When no operation is performed in step 4 (after a few seconds of inactivity), the balance selects the value currently displayed and returns to the weighing mode automatically.

11-6 Memory for Tare Value

- The data memory function can store 20 sets of tare value for weighing.
- The tare value in memory can be recalled easily using the MODE key and used for weighing.
- The tare value in memory can be recalled and changed.

Notes

The recalled tare value can be changed, using the digital input mode or the weighing input mode. The digital input mode enters the tare value using the keys. The weighing input mode uses a sample tare container to store the tare value.

The NET indicator illuminates during tare operation.
Storing the tare value

To store a new tare value: Recall the stored tare value to be changed ("t01" to "t20"). Then, change the recalled tare value using the digital input mode or the weighing input mode, and store the new value.

Notes

When the RE-ZERO key is pressed with nothing placed on the weighing pan, zero is displayed. The NET indicator does not illuminate.

"- - - " appears when a tare operation is performed without using the tare value stored in memory.

1. Press the MODE key to select a unit to be used for storage.

Note

While the data memory function is in use, unit selection using the MODE key is not available.

2. Set the "Data memory (dRef)" parameter to "5".

If "- - - " appears blinking in the upper left of the display, delete the data in memory as described in "11-1 Notes on Using Data Memory".

3. Press and hold the PRINT key until the balance enters the tare value confirmation mode. The tare value last selected is displayed as shown below.

<table>
<thead>
<tr>
<th>Tare number</th>
<th>PT</th>
</tr>
</thead>
<tbody>
<tr>
<td>(The third data in memory)</td>
<td></td>
</tr>
<tr>
<td>12345 kg</td>
<td></td>
</tr>
<tr>
<td>All the digits blinking</td>
<td></td>
</tr>
</tbody>
</table>

4. Select the tare number to be used, using the following keys.

   - RE-ZERO key: To increase the tare number by one.
   - MODE key: To decrease the tare number by one.
   - Each time the RE-ZERO key or MODE key is pressed, the displayed value changes as follows: .... ↔ t03 ↔ t04 ↔ .... ↔ t20 ↔ t01 ↔ ....
   - CAL key: To cancel the operation and return to the weighing mode.

5. To change the selected tare value:

   To use the weighing input mode, press the SAMPLE key to enter the weighing input mode. Go to "Weighing input mode" on the next page.

   To use the digital input mode, press the SAMPLE key, then press and hold the MODE key to enter the digital input mode. Go to "Digital input mode" on the next page.

Note

Using the "PN:mm" command, the tare value can be recalled. (mm indicates a two-digit numerical value 01-20, which corresponds to t01-t20.) The tare value recalled can be output using the "?PT" command and can be changed using the "PT:" command.
Weighing input mode

In the weighing input mode, a sample tare container is placed on the pan to store the tare value.

Notes

Pressing the **CAL** key will interrupt the operation and the balance will return to the tare value confirmation mode (step 3 in "Storing the tare value").

To go to the digital input mode, press and hold the **MODE** key.

1. The first display in the weighing input mode is the current weight value and the selected tare number with **PT** blinking.
2. Press the **RE-ZERO** key to set the display to zero.
3. Place a tare (a container) on the pan.
4. Press the **PRINT** key to store the tare value. Remove the tare from the pan.

Digital input mode

In the digital input mode, the tare value is entered digitally using the keys.

The display in the digital input mode is shown below.

```
- 03
 PT
 2.3456 kg
```

The digit to be changed blinks.

Use the following keys to store a tare value in digital input mode.

- **SAMPLE** key: To select the digit to be changed.
- **RE-ZERO** key: To change the value of the selected digit.
- **PRINT** key: To store the tare value.
- **CAL** key: To return to the tare value confirmation mode (step 3 in "Storing the tare value").
- **MODE** key: Press and hold to go to the weighing input mode.

To change the value

To select the digit

To store
Recalling the tare value (Quick selection mode)

The procedure below describes an easy way to recall the tare value to be used for weighing. When the recalled tare value is to be changed, refer to "Storing the tare value".

1. Set the "Data memory (dR=n)" parameter to "5".
2. Press the **MODE** key to enter the tare value recalling mode. The tare value last selected with its tare number appears. The display is as shown to the right, with all the digits blinking.
3. Press the **MODE** key to select the value. Each time the **MODE** key is pressed, the displayed value changes as follows: t03 → t04 → t05 → .... → t20 → t01 → .
4. Press the **PRINT** key to confirm the selection. The balance returns to the weighing mode with the selected tare value ready for use.

To cancel the selection, press the **CAL** key. The balance returns to the weighing mode.

**Note**

When no operation is performed in step 4 (after a few seconds of inactivity), the balance selects the value currently displayed and returns to the weighing mode automatically.

Canceling the tare value data

Cancel the tare value data as follows.

1. Remove everything from the weighing pan and press the **RE-ZERO** key to cancel the tare value.
11-7 Data Memory: Quick Selection Mode

The data memory has a quick selection mode, to recall data in memory quickly.
Using the quick selection mode, the comparator settings or the tare value, whichever is selected in
the function table, can be recalled, by a simple operation, using the **MODE** key.

**Note**

While the data memory function is in use, unit selection using the **MODE** key is not available.

Use the quick selection mode as follows.

1. Press the **MODE** key to enter the memory data recalling mode. The memory data last selected
appears with all the digits blinking.

2. Press the **MODE** key to select the value.

   Comparator settings: when the "Data memory (dRt-R)" parameter is set to "4"
   Each time the **MODE** key is pressed, the displayed value changes as follows:
   \[ \ldots CO3 \text{ HI} \rightarrow CO3 \text{ LO} \rightarrow CO4 \text{ HI} \rightarrow CO4 \text{ LO} \rightarrow \ldots \rightarrow \]
   \[ \rightarrow CO1 \text{ HI} \rightarrow \ldots \rightarrow \]

   Comparator number
   (The third data in memory)

   Upper limit value

   \[ 20000 \text{ kg} \]

   Tare value: when the "Data memory (dRt-R)" parameter is set to "5"
   Each time the **MODE** key is pressed, the displayed value changes as follows:
   \[ \ldots t03 \rightarrow t04 \rightarrow t05 \rightarrow \ldots \rightarrow t20 \rightarrow t01 \rightarrow \ldots \rightarrow \]

   Tare number
   (The third data in memory)

   \[ 12345 \text{ kg} \]

3. Press the **PRINT** key or leave the balance as is for a while (after a few seconds of inactivity) to confirm the
selection. The balance returns to the weighing mode with the selected data ready for use.

To cancel the selection, press the **CAL** key. The balance returns to the weighing mode.
11-8 Data Memory: Confirmation and Storage Mode

The confirmation and storage mode can change and store the recalled data.

Of the three types of memory data listed below, one may be selected in the function table, and is available for changes using this mode.

- Unit mass in the counting mode
- Comparator settings
- Tare value

Notes

To change the memory data other than specified in the function table, re-set the Data memory (d2R-A) parameter of the function table.

For a detailed description of the procedure for each memory data, see the relevant section.

Use the confirmation and storage mode as follows.

1. Press and hold the [PRINT] key to enter the memory data recalling mode. The memory data last selected appears with all the digits blinking.

2. Use the following keys to select the value.
   - RE-ZERO key: To increase the memory data number by one.
   - MODE key: To decrease the memory data number by one.

   Unit mass: when the "Data memory (d2R-A)" parameter is set to "2"
   Each time the MODE key or RE-ZERO key is pressed, the displayed value changes as follows:
   
   .... PO3 ⇔ PO4 ⇔ PO5 ⇔ .... ⇔ P20 ⇔ PO1 ⇔ ....

   Comparator settings: when the "Data memory (d2R-A)" parameter is set to "4"
   Each time the MODE key or RE-ZERO key is pressed, the displayed value changes as follows:
   
   .... CO3 HI ⇔ CO3 LO ⇔ CO4 HI ⇔ CO4 LO ⇔ .... ⇔ CO2 LO ⇔ CO1 HI ⇔ ....

   Tare value: when the "Data memory (d2R-A)" parameter is set to "5"
   Each time the MODE key or RE-ZERO key is pressed, the displayed value changes as follows:
   
   .... tO3 ⇔ tO4 ⇔ tO5 ⇔ .... ⇔ t20 ⇔ tO1 ⇔ ....

3. To perform a weighing using the selected memory data
   Press the PRINT key to confirm the selection. The balance will return to the weighing mode with the selection ready for use.

To change and store the selected memory data

Press the [SAMPLE] key to enter the storage mode.

Two inputting modes are available for entering the value to be stored.

- Digital input mode
- Weighing input mode

To switch the inputting mode, press and hold the MODE key.

To cancel the operation and return to the weighing mode, press the CAL key.
12. PROGRAMMABLE-UNIT

This is a programmable unit conversion function. It multiplies the weighing data in kilograms by an arbitrary coefficient set in the function table and displays the result.

The coefficient must be within the range between the minimum and maximum shown below. If the coefficient set is beyond the range, an error is displayed and the balance returns to the coefficient setting mode, prompting to enter an appropriate value. A coefficient of 1 was set at the factory.

<table>
<thead>
<tr>
<th>Model</th>
<th>Minimum coefficient</th>
<th>Maximum coefficient</th>
</tr>
</thead>
<tbody>
<tr>
<td>GP-12K/20K/30K/30KS/40K</td>
<td>0.000001</td>
<td>10000</td>
</tr>
<tr>
<td>GP-60K/100K/100KS</td>
<td></td>
<td>1000</td>
</tr>
<tr>
<td>GP-22K</td>
<td></td>
<td>100</td>
</tr>
<tr>
<td>GP-102K</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Operation
1. Press and hold the [SAMPLE] key until the [FND] of the function table is displayed, then release the key.
2. Press the [SAMPLE] key several times to display [nLb].
3. Press the [PRINT] key. The balance enters the mode to confirm or set the coefficient.

Confirming the coefficient
4. The current coefficient is displayed with the first digit blinking.
   - When it is not to be changed, press the [CAL] key and proceed to step 8.
   - When it is to be changed, press the [RE-ZERO] key and proceed to step 6.

Setting the coefficient
5. Set the coefficient using the following keys.
   - [SAMPLE] key: To select a digit to change the value. The selected digit blinks.
   - [RE-ZERO] key: To change the value.
   - [MODE] key: To change the decimal point position. Each time the switch is pressed, the decimal point position changes as follows:
     \[ 0.000001 \rightarrow 0.00001 \rightarrow \ldots \rightarrow 0.000001 \rightarrow 0.00001 \]
   - [PRINT] key: To store the new setting, display [End] and go to step 6.
   - [CAL] key: To cancel the new setting and go to step 6.

Quitting the operation
6. The balance displays [Lo nL]. Press the [CAL] key to exit the programmable-unit function and return to the weighing mode.

Using the function
Press the [MODE] key to select the programmable-unit (no display on the unit section). Perform weighing as described in "5-1 Basic Operation (Kilogram Mode)". After weighing, the balance displays the result (weighing data in kilograms x coefficient).
13. DENSITY MEASUREMENT

The GP series balance is equipped with a density mode. It calculates the density of a solid using the weight of a sample in air and the weight in liquid.

- The density mode was not selected for use when the balance was shipped from the factory. To use the mode, change the function table and activate the density mode.
- Inputting order of the parameters necessary for density measurement, can be changed.
- A part of the parameters can be changed and used for re-calculating the density. Press the [SAMPLE] key to confirm or select each parameter. The parameters are stored in non-volatile memory. Each time a part of the parameters are changed, the density can be re-calculated.
- Two ways to set the density of a liquid are available in the function table, "Liquid density input (L d in)"; by entering the water temperature or by entering the density directly.
- When the density mode is selected, the response adjustment and self check function can not be used.

Formula to obtain the density
The density can be obtained by the following formula.

$$ \rho = \frac{A}{A - B} \times \rho_0 $$

Where

- $\rho$: Density of a sample
- $A$: Weight value of a sample in air
- $B$: Weight value of a sample in liquid
- $\rho_0$: Density of a liquid

Prior to measurement: Changing the function table
Prior to measurement, change the function table as follows.

(1) Selecting the density mode
The density mode is available as one of the weighing units. Select it by pressing the [MODE] key. To use the mode, select it in the function table. For details, refer to "4-2 Changing the Units".

(2) Selecting a way to set the density of a liquid
Select the liquid density input method from the function table below. The function table is available only when the density mode is selected.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

0 = Factory setting

Measuring the density

Note
If the liquid temperature or the type of liquid is changed during measurement, reset the value of the liquid density as necessary. For details, refer to “C. Entering the density of a liquid.”

(1) Entering the density mode
1. Press the [MODE] key as necessary to select the density mode. When the density mode begins, “d-F” (weight in air), "g (kg for the GP-102K)” for the unit and the processing indicator are turned on.
(2) Selecting a parameter to set.

1. Press the **SAMPLE** key to select a parameter to set. Each pressing of the key switches the parameter.
2. Press the **RE-ZERO** key to enter the inputting mode of the parameter selected.

(3) Setting the parameter.

A. Entering the weight of a sample in air.

1. Confirm that nothing is placed on the upper pan (in air). Press the **RE-ZERO** key to set the display to zero.
2. Place a sample on the upper pan. When the value displayed on the balance becomes stable, press the **PRINT** key. The sample weight in air is confirmed and the balance will return to the density mode (the condition of step 1, (2) Selecting a parameter to set).
3. Remove the sample from the upper pan.

   \[ d - R \]

   \[ 0.5 \text{ g} \]  \[ \rightarrow \]  \[ 0.0 \text{ g} \]  \[ \rightarrow \]  \[ 1234.5 \text{ g} \]  \[ \rightarrow \]  \[ 1234.5 \text{ g} \]

   Press  \[ \downarrow \text{RE-ZERO} \]  Place a sample  \[ \circ \text{PRINT} \]  to confirm the data

Notes

If an unstable value, a negative value or \( E \) (error) is displayed, the **PRINT** key is disabled.

The **SAMPLE** key cannot be used to change the minimum weighing value.

B. Entering the weight of a sample in liquid.

1. Confirm that nothing is placed on the lower pan (in liquid). Press the **RE-ZERO** key to set the display to zero.
2. Place a sample on the lower pan (in liquid). When the value displayed on the balance becomes stable, press the **PRINT** key. The sample weight in liquid is confirmed and the balance will return to the density mode (the condition of step 1, (2) Selecting a parameter to set).
3. Remove the sample from the lower pan.

   \[ d - b \]

   \[ 0.5 \text{ g} \]  \[ \rightarrow \]  \[ 0.0 \text{ g} \]  \[ \rightarrow \]  \[ 987.6 \text{ g} \]  \[ \rightarrow \]  \[ 987.6 \text{ g} \]

   Press  \[ \downarrow \text{RE-ZERO} \]  Place a sample  \[ \circ \text{PRINT} \]  to confirm the data

Notes

If an unstable value or \( E \) (error) is displayed, the **PRINT** key is disabled.

The **SAMPLE** key cannot be used to change the minimum weighing value.
C. Entering the density of a liquid.

Two ways to set the density of a liquid are available in the function table, "Liquid density input (L d in)" by entering the water temperature or by entering the density directly.

- Enter the water temperature (L d in T)

  The water temperature currently set (unit: °C, factory setting: 25°C) is displayed.

  Use the following keys to change the value.

  **RE-ZERO** key: To increase the temperature by one degree. (0-99°C)
  **MODE** key: To decrease the temperature by one degree. (0-99°C)
  **PRINT** key: To store the change, display [End] and return to the density mode (the condition of step 1, (2) Selecting a parameter to set).
  **CAL** key: To cancel the change and return to the density mode (the condition of step 1, (2) Selecting a parameter to set).

The relation between the water temperature and density is shown below.

</tbody>
</table>

- Enter the density directly (L d in d)

  The density currently set (unit: g / cm³, factory setting: 1.00000 g / cm³) is displayed.

  Use the following keys to change the value.

  **RE-ZERO** key: To set the value of the digit selected.
  **SAMPLE** key: To select the digit to change the value.
  **PRINT** key: To store the change, display [End] and return to the density mode (the condition of step 1, (2) Selecting a parameter to set).
  **CAL** key: To cancel the change and return to the density mode (the condition of step 1, (2) Selecting a parameter to set).

**Note**

The range to set the density is 0.0000 to 1.9999 g / cm³

(4) Outputting the density.

After all the necessary parameters have been set, press the **SAMPLE** key to output the density calculated.

**Note**

The density is displayed with three decimal places.

RS-232C
The balance is a DCE device. Connect the balance to a personal computer (DTE) using a straight through cable.

Transmission system : EIA RS-232C
Transmission form : Asynchronous, bi-directional, half duplex
Transmission rate : 10 times/second or 5 times/second (same as data refresh rate)
Data format :
  Baud rate : 600, 1200, 2400, 4800, 9600, 19200bps
  Data bits : 7 or 8 bits
  Parity : Even, Odd (Data bits 7 bits)
           None  (Data bits 8 bits)
  Stop bit : 1 bit
           (When sending, 2 bits; receiving, 1 bit.
            A personal computer will function with either setting.)
Code : ASCII

RS-232C

[-5V to -15V] 0 1 2 3 4 5 6 0 +5V to +15V

Start bit  Stop bit  Data bits  Parity bit
External contact input
By connecting pin 18 to pin 7, or pin 19 to pin 7, for more than 100 ms, the same operation as performed by pressing the RE-ZERO key or the PRINT key, will be performed.

Use of example

The external input connector (AX-HDB-25P/CTF) and the foot switch (AX-SW128) are sold separately.
15. CONNECTION TO PERIPHERAL EQUIPMENT

15-1 Connection to the AD-8121 Printer

Set the following parameters to use the AD-8121 printer.

</tbody>
</table>

Refer to "10. ID NUMBER AND GLP REPORT" for a print sample.

15-2 Connection to a Computer

The GP series balance is of the DCE type (Data Communication Equipment), which can be connected to a personal computer using the RS-232C interface.

Before connection, read the personal computer manual thoroughly.

Use a standard DCE cable for connection (cable type: straight-through).

When the personal computer type is a DOS/V with a 9-pin port, use a straight-through cable with a 25-pin male connector and a 9-pin female connector.

15-3 Using Windows Communication Tools (WinCT)

When Windows 95 or 98 is used as an operating system in a personal computer, the provided WinCT software can be used to transmit the weighing data to the personal computer.

The WinCT software has two communication methods: "RsCom" and "RsKey". For details on WinCT, refer to the WinCT instruction manual.
RsCom

- Can transmit commands to control the balance.
- Can make bi-directional communication between the balance and a personal computer using the RS-232C interface.
- Can display or store the data using a text file format. Can also print the data using a printer connected to the personal computer.
- When several ports of a personal computer have balances connected, can communicate with each balance simultaneously.
- Can share a personal computer with other application software.
- Can receive the balance GLP report.

RsKey

- Can transmit the weighing data output from the balance directly to other application software such as Microsoft Excel.
- Can be used with most application software.
- Can receive the balance GLP report.

Note

Windows and Excel are registered trademarks of Microsoft Corporation.

15-4 Using the WinCT software, the balance can do the following:

1. Analyzing the weighing data and the statistics with “RsKey”
   The weighing data can be input directly into an Excel worksheet. Then, Excel can analyze the data to obtain total, average, standard deviation, maximum and minimum value, and display them in a graph.

2. Controlling the balance using commands from a personal computer
   By using “RsCom”, the personal computer sends commands such as “re-zero” or “send weighing data” to the balance and controls the balance.

3. Printing the balance GLP report using your printer
   The balance GLP report can be printed using a printer connected to the personal computer.

4. Receiving weighing data at a certain interval
   The weighing data can be received at a certain interval and data characteristic with elapsed time can be obtained.

5. Using the GP series balance memory function
   The data can be stored in the balance’s memory. Of the data stored, the weighing data and calibration data can be transmitted to a personal computer at one time.

6. Using a personal computer as an external indicator
   With the “RsKey” test mode function, a personal computer can be used as an external weight indicator for the balance. (To do this, set the balance data output mode to stream mode.)
16. COMMANDS

16-1 Command List

Note
A command has a terminator added, that is specified using “S LF” of the function table, and is sent to the balance.

<table>
<thead>
<tr>
<th>Commands to query weighing data</th>
</tr>
</thead>
<tbody>
<tr>
<td>C Cancels the S or SIR command.</td>

</tr>
<tr>
<td>(To set the lower limit value to 1000.0 g:  indicates a space.)</td>
</tr>
<tr>
<td>?HI Requests the upper limit value.</td>
</tr>
<tr>
<td>?LO Requests the lower limit value.</td>
</tr>
<tr>
<td>PN:mm Recalls the tare value in memory. (mm indicates 01-20)</td>
</tr>
<tr>
<td>?PN Request the tare number of the selected value. (mm indicates 01-20)</td>
</tr>
<tr>
<td>PT:#####. *  g Sets the tare value.</td>
</tr>
<tr>
<td>Command e.g.: PT:+001000.0  g</td>
</tr>
<tr>
<td>(To set the tare value to 1000.0 g:  indicates a space.)</td>
</tr>
<tr>
<td>?PT Request the tare value.</td>
</tr>
<tr>
<td>MCL Deletes all data in memory.</td>
</tr>
<tr>
<td>MD:nnn Deletes data with the data number nnn.</td>
</tr>
<tr>
<td>?MA Outputs all weighing data in memory.</td>
</tr>
<tr>
<td>?MQ:nnn Outputs data with the data number nnn.</td>
</tr>
<tr>
<td>?MX Outputs the number of data in memory (the last data number)</td>
</tr>
</tbody>
</table>

Notes
When a unit is required in commands such as a “PT:” command, use the 3-digit unit code of the A&D standard format.

nnn indicates a three-digit numerical value.
16-2 Acknowledge Code and Error Codes

When the “Serial interface function ( 5 iF )” parameter is set to “ErCd 1”, the balance outputs <AK> code or error code to each command as follows:

<AK> (06h) Acknowledge in ASCII code.

- When the balance receives a command to request data and can not process it, the balance transmits an error code (EC, Exx).
  When the balance receives a command to request data and can process it, the balance outputs the data.

- When the balance receives a command to control the balance and can not process it, the balance transmits an error code (EC, Exx).
  When the balance receives a command to control the balance and can process it, the balance transmits the acknowledge code.

Among commands to control the balance, the following transmit the acknowledge code both when the balance receives the command and when the balance has accomplished the command. If the command can not be processed properly, the balance transmits an error code (EC, Exx). This error can be released using the CAL command.

CAL command (Calibration command) ON command (Display ON command)
P command (Display ON/OFF command) R command (RE-ZERO command)

- When a communication error has occurred due to external noise, or a parity error has occurred due to transmission error, the balance transmits an error code. In this case, send the command again.

16-3 Control Using CTS and RTS

Depending on the “Ct5” parameter of “Serial interface ( 5 iF )”, the balance performs as follows:

Ct5 0
Regardless of whether the balance can receive a command or not, the balance keeps the CTS line HI. The balance outputs data regardless of the condition of the RTS line.

Ct5 1
The CTS line is kept HI normally. When the balance can not receive the next command (e.g. while the balance is processing last command), the balance sets the CTS line to LO. The balance confirms the level of the RTS line before outputting a set of data. If the RTS level is HI, the balance outputs data. If the RTS level is LO, data is not output (The data is canceled).

16-4 Settings Related to RS-232C

Concerning the RS-232C, the balance has two functions: “Data output (dout)” and “Serial interface ( 5 iF )”. Set each function as necessary.
17. MAINTENANCE

- Do not disassemble the balance. Contact the local A&D dealer if the balance needs service or repair.
- Use the original packing material for transportation.
- Do not use organic solvents to clean the balance. Clean the balance with a lint free cloth that is moistened with warm water and a mild detergent.
- The mass of the internal mass may change due to corrosion or other damage caused by the operating environment, or due to aging. Check the internal mass using an external weight periodically.

18. TROUBLESHOOTING

18-1 Checking the Balance Performance and Environment

The balance is a precision instrument. When the operating environment or the operating method is inadequate, correct weighing cannot be performed. Place a sample on the pan and remove it, and repeat this several times. If the balance seems to have a problem with repeatability or to perform improperly, check as described below. If improper performance persists after checking, contact the local A&D dealer for repair.

Checking that the balance performs properly

- Check the balance performance using the self-check function as described in "6-1 Automatic Response Adjustment / Self Check Function".
  An error display appears when a malfunction is found.
- Check the balance repeatability using an external weight. Be sure to place the weight in the center of the weighing pan.
- Check the balance repeatability, linearity and calibrated value using external weights with a known value.

Checking that the operating environment or weighing method is proper

Operating environment

- Is the weighing table solid enough?
- Is the balance level? Refer to "3-1 Before Use".
- Is the operating environment free from vibration and drafts?
- Is there a strong electrical or magnetic noise source such as a motor near the balance?

Weighing method

- Does the weighing pan touch the breeze ring or anything? Is the weighing pan installed correctly?
- Is the [RE-ZERO] key pressed before placing a sample on the weighing pan?
- Is the sample placed in the center of the weighing pan?
- Has the balance been calibrated using the internal mass (one-touch calibration)?
- Has the balance been warmed up for 30 minutes before weighing?
Sample and container
- Has the sample absorbed or lost moisture due to the ambient conditions such as temperature and humidity?
- Has the temperature of the container been allowed to equalize to the ambient temperature? Refer to “3-2 During Use”.
- Is the sample charged with static electricity? Refer to “3-2 During Use”.
- Is the sample of magnetic material such as iron? Caution is required for weighing magnetic materials. Refer to “3-2 During Use”.

### 18-2 Error Codes

<table>
<thead>
<tr>

<td>Undefined command error</td>
<td>An undefined command was received. Confirm the command.</td>
</tr>
<tr>
<td>EC, E02</td>
<td>Not ready</td>
<td>A received command can not be processed. e.g. The balance received a Q command, but not in the weighing mode. e.g. The balance received a Q command while processing a RE-ZERO command. Adjust the delay time to transmit a command.</td>
</tr>
<tr>
<td>EC, E03</td>
<td>Timeout error</td>
<td>If the timeout parameter is set to &quot;t−UP l&quot;, the balance did not receive the next character of a command within the time limit of one second. Confirm the communication.</td>
</tr>
<tr>
<td>EC, E04</td>
<td>Excess characters error</td>
<td>The balance received excessive characters in a command. Confirm the command.</td>
</tr>
<tr>
<td>EC, E06</td>
<td>Format error</td>
<td>A command includes incorrect data. e.g. The data is numerically incorrect. Confirm the command.</td>
</tr>
<tr>
<td>EC, E07</td>
<td>Parameter setting error</td>
<td>The received data exceeds the range that the balance can accept. Confirm the parameter range of the command.</td>
</tr>
</tbody>
</table>

Other errors

If the errors described above can not be released or other errors are displayed, contact the local A&D dealer.

Other symbol

When this indicator blinks, automatic self calibration is required. The indicator blinks when the balance detects changes in ambient temperature. If the balance is not used for several minutes with this indicator blinking, the balance performs automatic self calibration. The blinking period depends on the operating environment.

18-3 Asking For Repair

If the balance needs service or repair, contact the local A&D dealer.

The balance is a precision instrument. Use much care when handling the balance and observe the following when transporting the balance.

- Use the original packing material.
- Remove the weighing pan from the main unit.

* The GP-22K and GP-102K allow weighing using a precision range, even with a heavy tare placed on the pan. (Smart range function)

** When automatic self calibration is not used, at 10°C to 30°C (50°F to 86°F)

*** Accuracy right after calibration using the internal mass in good ambient conditions (within the temperature range of 10°C to 30°C (50°F to 86°F) with no abrupt changes in temperature or humidity, no drafts, no effect by magnetic fields or static electricity).

Check the internal mass periodically as described in "17. MAINTENANCE".

**** The cable length, for the separate display type balances (GP-30KS/100KS), is 3 meters.
20. EXTERNAL DIMENSIONS

Standard Type: GP-12K/20K/22K/30K/40K/60K/100K/102K

Note
The size in parentheses is for the GP-100K/102K

Unit: mm
Separate Display Type: GP-30KS/100KS

Note
The size in parentheses is for GP-100KS

Main unit bottom
Unit: mm
21. OPTIONS

AD-8121 Printer
- Compact thermal dot-matrix printer
- Statistical function, clock and calendar function, interval print function, graphic print function, terminal mode
- 5 x 7 dots, 16 characters per line
- Print paper (AX-PP143, 45 (W) x 50 (L) mm, Ø65 mm)
- AC adapter or alkaline battery

OP-04: Comparator output (relay/ with a buzzer)/RS-232C/Current loop
- Generates a relay output corresponding to HI, OK and LO in the display.
- Current loop and RS-232C can be used at the same time. For example, a personal computer and an AD-8121 printer can be used simultaneously:
- Installed in place of the standard RS-232C serial interface.

OP-06: Analog voltage output/Current loop
- Gains a voltage of 0-1V (or 0.2-1V) depending on the displayed value.
- With this option, current loop can be used. For example, an AD-8121 printer can be used simultaneously using this option.
- Installed in place of the standard RS-232C serial interface. So, RS-232C is not available for use.

OP-07: Extension cable, 5 m (Available as factory option only when ordered with a GP balance)
- Applicable balance models: GP-30KS/100KS
- A cable of 5 meters, to connect between the display and the main unit

OP-20: Underhook
- Applicable balance models: GP-12K/20K/22K/30K/30KS/40K
- Used for measuring the density of magnetic materials and concrete (coarse aggregates).

OP-21: Underhook
- Applicable balance models: GP-60K/100K/100KS/102K
- Used for measuring the density of magnetic materials and concrete (coarse aggregates).

OP-22: Printer bracket
- Used to place the AD-8121 printer beside the display.

AD-1682 Rechargeable battery
- Allows use of the balance in a place where AC power is not available.

AD-8524A/B: Keyboard adapter
- Used to connect the balance to a personal computer with appropriate OS and applications.

AD-8920: Remote display
- Connected to the GP series RS-232C output.

AX-SW128: Foot switch
- Used to externally transmit a RE-ZERO or PRINT signal to the balance.
22. TERMS/INDEX

Terms

Stable value The stable weight data, indicated by the illuminated stabilization indicator.

Environment Ambient conditions such as vibration, drafts, temperature, static electricity and magnetic fields which affect the weighing operation.

Store To save the weighing data, unit mass or calibration data using the data memory function.

Calibration Adjustment of the balance so that it can weigh accurately.

Output To output the weighing data using the RS-232C interface.

Zero point A weighing reference point. Usually refers to the value displayed when nothing is on the weighing pan.

Smart range function Allows weighing in the precision range, even if a heavy tare is used.

Data number Numbers assigned sequentially when weighing data or unit weight is stored.

Digit The minimum weighing value available. Used for the balance, 1 digit is the smallest displayable mass.

Tare To cancel the weight of a container which is not to be included in the weighing data. Normally, refers to an operation of placing a container and setting the display to zero.

Mode Balance operational function.

Re-zero To set the display to zero.

GLP Good Laboratory Practice.

Repeatability Variation in measured values obtained when the same mass is placed and removed repetitively. Usually expressed as a standard deviation.

E.g. Standard deviation = 1 digit: This means that measured values, obtained when the same sample is placed and removed repetitively, fall within ±1 digit in the frequency of about 68%.

Stabilization time Time required after a sample being placed, until the stabilization indicator illuminates and the weighing data is displayed.

Sensitivity drift An affect that a change in temperature causes to the weighing data. Expressed as temperature coefficient.

E.g. Temperature coefficient = 2 ppm/°C : If a load is 20 kg and the temperature changes by 10°C, the value displayed changes by the following value.

0.0002%/°C x 10°C x 20 kg = 0.4 g

In this example, if the value displayed is 20.0000 kg before temperature changes, a temperature change of 10°C will make the value displayed 20.0004 kg.
